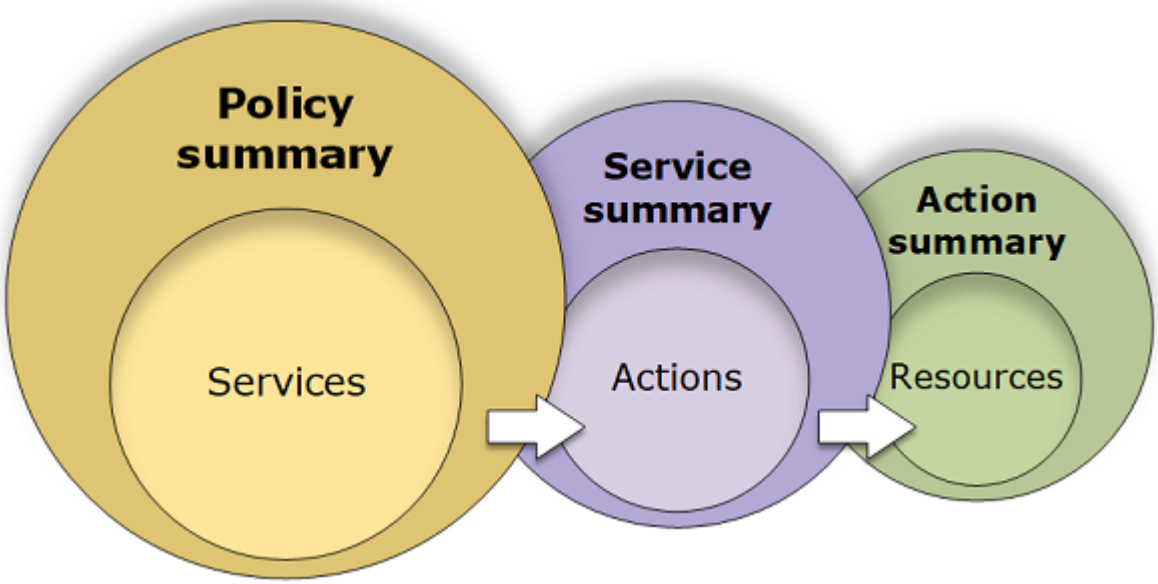
Policy summaries

The IAM console includes *policy summary* tables that describe the access level, resources, and conditions that are allowed or denied for each service in a policy. Policies are summarized in three tables: the policy summary, the service summary, and the action summary. The *policy summary* table includes a list of services. Choose a service there to see the *service summary*. This summary table includes a list of the actions and associated permissions for the chosen service. You can choose an action from that table to view the *action summary*. This table includes a list of resources and conditions for the chosen action.



You can view policy summaries on the **Users** page or **Roles** page for all policies (managed and inline) that are attached to that user. View summaries on the **Policies** page for all managed policies. Managed policies include AWS managed policies, AWS managed job function policies, and customer managed policies. You can view summaries for these policies on the **Policies** page regardless of whether they are attached to a user or other IAM identity.

You can use the information in the policy summaries to understand the permissions that are allowed or denied by your policy. Policy summaries can help you troubleshoot and fix policies that are not providing the permissions that you expect.

For step-by-step instructions on viewing summaries, see View policy summaries, View service summaries, and View action summaries.

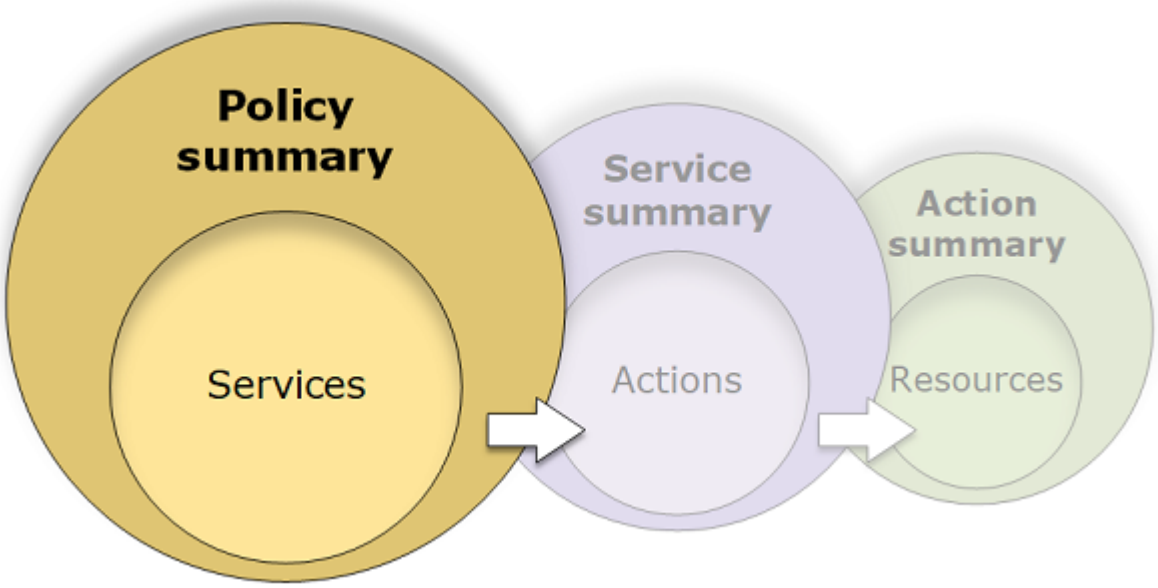
Topics

- Policy summary (list of services)

- Access levels in policy summaries
- Service summary (list of actions)
- Action summary (list of resources)
- Examples of policy summaries

Policy summary (list of services)

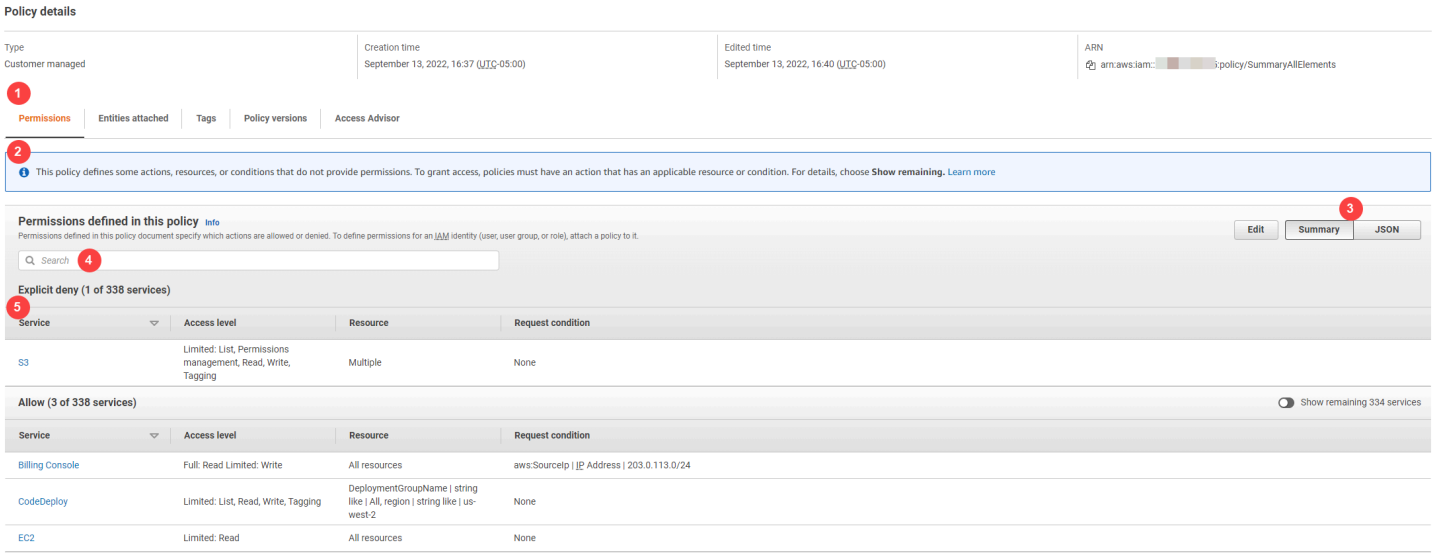
Policies are summarized in three tables: the policy summary, the service summary, and the action summary. The *policy summary* table includes a list of services and summaries of the permissions that are defined by the chosen policy.



The policy summary table is grouped into one or more **Uncategorized services**, **Explicit deny**, and **Allow** sections. If the policy includes a service that IAM does not recognize, then the service is included in the **Uncategorized services** section of the table. If IAM recognizes the service, then it is included under the **Explicit deny** or **Allow** sections of the table, depending on the effect of the policy (`Deny` or `Allow`).

Understanding the elements of a policy summary

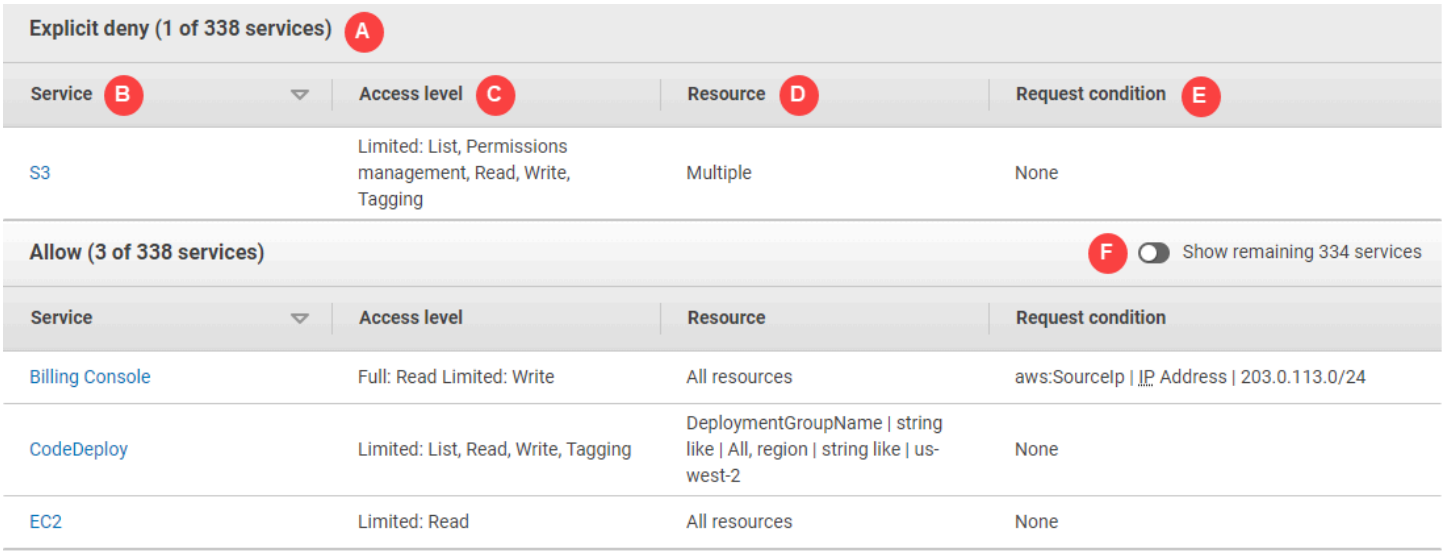
In the following example of a policy details page, the **SummaryAllElements** policy is a managed policy (customer managed policy) that is attached directly to the user. This policy is expanded to show the policy summary.



In the preceding image, the policy summary is visible from within the **Policies** page:

1. The **Permissions** tab includes the permissions defined in the policy.
2. If the policy does not grant permissions to all the actions, resources, and conditions defined in the policy, then a warning or error banner appears at the top of the page. The policy summary then includes details about the problem. To learn how policy summaries help you to understand and troubleshoot the permissions that your policy grants, see the section called “My policy does not grant the expected permissions”.
3. Use the **Summary** and **JSON** buttons to toggle between the policy summary and the JSON policy document.
4. Use the **Search** box to reduce the list of services and find a specific service.
5. The expanded view shows additional details of the **SummaryAllElements** policy.

The following policy summary table image shows the expanded **SummaryAllElements** policy on the policy details page.



Explicit deny (1 of 338 services) A

Service B	Access level C	Resource D	Request condition E
S3	Limited: List, Permissions management, Read, Write, Tagging	Multiple	None

Allow (3 of 338 services) F Show remaining 334 services

Service	Access level	Resource	Request condition
Billing Console	Full: Read Limited: Write	All resources	aws:SourceIp | IP Address | 203.0.113.0/24
CodeDeploy	Limited: List, Read, Write, Tagging	DeploymentGroupName | string like | All, region | string like | us-west-2	None
EC2	Limited: Read	All resources	None

In the preceding image, the policy summary is visible from within the **Policies** page:

A. For those services that IAM recognizes, it arranges services according to whether the policy allows or explicitly denies the use of the service. In this example, the policy includes a `Deny` statement for the Amazon S3 service and `Allow` statements for the Billing, CodeDeploy, and Amazon EC2 services.

B. **Service** – This column lists the services that are defined within the policy and provides details for each service. Each service name in the policy summary table is a link to the *service summary* table, which is explained in Service summary (list of actions). In this example, permissions are defined for the Amazon S3, Billing, CodeDeploy, and Amazon EC2 services.

C. **Access level** – This column tells whether the actions in each access level (`List`, `Read`, `Write`, `Permission Management`, and `Tagging`) have `Full` or `Limited` permissions defined in the policy. For additional details and examples of the access level summary, see Access levels in policy summaries.

- **Full access** – This entry indicates that the service has access to all actions within all four of the access levels available for the service.
- If the entry does not include **Full access**, then the service has access to some but not all of the actions for the service. The access is then defined by following descriptions for each of the access level classifications (`List`, `Read`, `Write`, `Permission Management`, and `Tagging`):

  Full: The policy provides access to all actions within each access level classification listed. In this example, the policy provides access to all of the Billing `Read` actions.

Limited: The policy provides access to one or more but not all actions within each access level classification listed. In this example, the policy provides access to some of the Billing `Write` actions.

D. **Resource** – This column shows the resources that the policy specifies for each service.

- **Multiple** – The policy includes more than one but not all of the resources within the service. In this example, access is explicitly denied to more than one Amazon S3 resource.
- **All resources** – The policy is defined for all resources within the service. In this example, the policy allows the listed actions to be performed on all Billing resources.
- Resource text – The policy includes one resource within the service. In this example, the listed actions are allowed on only the `DeploymentGroupName` CodeDeploy resource. Depending on the information that the service provides to IAM, you might see an ARN or you might see the defined resource type.

> **Note**
>
> This column can include a resource from a different service. If the policy statement that includes the resource does not include both actions and resources from the same service, then your policy includes mismatched resources. IAM does not warn you about mismatched resources when you create a policy, or when you view a policy in the policy summary. If this column includes a mismatched resource, then you should review your policy for errors. To better understand your policies, always test them with the policy simulator.

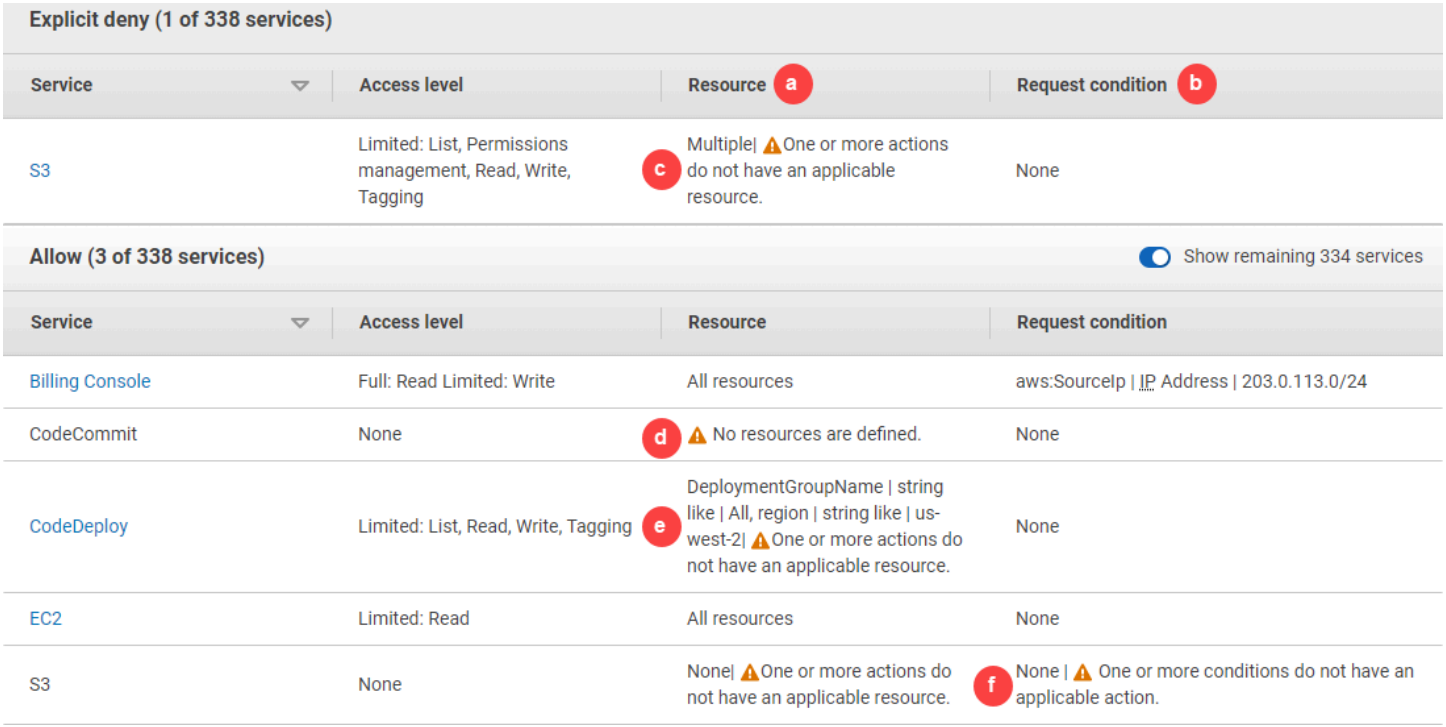
E. **Request condition** – This column indicates whether the services or actions associated with the resource are subject to conditions.

- **None** – The policy includes no conditions for the service. In this example no conditions are applied to the denied actions in the Amazon S3 service.
- Condition text – The policy includes one condition for the service. In this example, the listed Billing actions are allowed only if the IP address of the source matches `203.0.113.0/24`.
- **Multiple** – The policy includes more than one condition for the service. To view each of the multiple conditions for the policy, choose **JSON** to view the policy document.

F. **Show remaining services** – Toggle this button to expand the table to include the services that are not defined by the policy. These services are *implicitly denied* (or denied by default) within this policy. However, a statement in another policy might still allow or explicitly deny using the service. The policy summary summarizes the permissions of a single policy. To learn about

how the AWS service decides whether a given request should be allowed or denied, see Policy evaluation logic.

When a policy or an element within the policy does not grant permissions, IAM provides additional warnings and information in the policy summary. The following policy summary table shows the expanded **Show remaining services** services on the **SummaryAllElements** policy details page with the possible warnings.



Explicit deny (1 of 338 services)

Service	Access level	Resource a	Request condition b
S3	Limited: List, Permissions management, Read, Write, Tagging	c Multiple| ⚠ One or more actions do not have an applicable resource.	None

Allow (3 of 338 services) Show remaining 334 services

Service	Access level	Resource	Request condition
Billing Console	Full: Read Limited: Write	All resources	aws:SourceIp | IP Address | 203.0.113.0/24
CodeCommit	None	d ⚠ No resources are defined.	None
CodeDeploy	Limited: List, Read, Write, Tagging	e DeploymentGroupName | string like | All, region | string like | us-west-2| ⚠ One or more actions do not have an applicable resource.	None
EC2	Limited: Read	All resources	None
S3	None	None| ⚠ One or more actions do not have an applicable resource.	f None | ⚠ One or more conditions do not have an applicable action.

In the preceding image, you can see all services that include defined actions, resources, or conditions with no permissions:

a. **Resource warnings** – For services that do not provide permissions for all of the included actions or resources, you see one of the following warnings in the **Resource** column of the table:

- ⚠

  No resources are defined. – This means that the service has defined actions but no supported resources are included in the policy.

- ⚠

  One or more actions do not have an applicable resource. – This means that the service has defined actions, but that some of those actions don't have a supported resource.

-

  One or more resources do not have an applicable action. – This means that the service has defined resources, but that some of those resources don't have a supporting action.

  If a service includes both actions that do not have an applicable resource and resources that do have an applicable resource, then only the **One or more resources do not have an applicable action.** warning is shown. This is because when you view the service summary for the service, resources that do not apply to any action are not shown. For the `ListAllMyBuckets` action, this policy includes the last warning because the action does not support resource-level permissions, and does not support the `s3:x-amz-acl` condition key. If you fix either the resource problem or the condition problem, the remaining issue appears in a detailed warning.

b. **Request condition warnings** – For services that do not provide permissions for all of the included conditions, you see one of the following warnings in the **Request condition** column of the table:

   -

     One or more actions do not have an applicable condition. – This means that the service has defined actions, but that some of those actions don't have a supported condition.

   -

     One or more conditions do not have an applicable action. – This means that the service has defined conditions, but that some of those conditions don't have a supporting action.

c. **Multiple |**

   One or more actions do not have an applicable resource. – The `Deny` statement for Amazon S3 includes more than one resource. It also includes more than one action, and some actions support the resources and some do not. To view this policy, see the section called "**SummaryAllElements** JSON policy document". In this case, the policy includes all Amazon S3 actions, and only the actions that can be performed on a bucket or bucket object are denied.

d.

   No resources are defined – The service has defined actions, but no supported resources are included in the policy, and therefore the service provides no permissions. In this case, the policy includes CodeCommit actions but no CodeCommit resources.

e. **DeploymentGroupName | string like | All, region | string like | us-west-2 |**

One or more actions do not have an applicable resource. – The service has a defined action, and at least one more action that does not have a supporting resource.

f. **None |**

One or more conditions do not have an applicable action. – The service has at least one condition key that does not have a supporting action.

SummaryAllElements JSON policy document

The **SummaryAllElements** policy is not intended for you to use to define permissions in your account. Rather, it is included to demonstrate the errors and warnings that you might encounter while viewing a policy summary.

                }
            }
        }
    ]
}
```

View policy summaries

You can view the policy summaries for any policies that are attached to an IAM user or role. For managed policies, you can view policy summaries on the **Policies** page. If your policy does not include a policy summary, see Missing policy summary to learn why.

Viewing policy summaries from the Policies page

You can view the policy summary for managed policies on the **Policies** page.

To view the policy summary from the Policies page

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane, choose **Policies**.
3. In the list of policies, choose the name of the policy that you want to view.
4. On the **Policy details** page for the policy, view the **Permissions** tab to see the policy summary.

Viewing a policy summary for a policy attached to a user

You can view the policy summary for any policies that are attached to an IAM user.

To view the summary for a policy attached to a user

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.

2. Choose **Users** from the navigation pane.
3. In the list of users, choose the name of the user whose policy you want to view.
4. On the **Summary** page for the user, view the **Permissions** tab to see the list of policies that are attached to the user directly or from a group.
5. In the table of policies for the user, expand the row of the policy that you want to view.

Viewing a policy summary for a policy attached to a role

You can view the policy summary for any policies that are attached to a role.

To view the summary for a policy attached to a role

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane, choose **Roles**.
3. In the list of roles, choose the name of the role whose policy you want to view.
4. On the **Summary** page for the role, view the **Permissions** tab to see the list of policies that are attached to the role.
5. In the table of policies for the role, expand the row of the policy that you want to view.

Editing policies to fix warnings

While viewing a policy summary, you might find a typo or notice that the policy does not provide the permissions that you expected. You cannot edit a policy summary directly. However, you can edit a customer managed policy using the visual policy editor, which catches many of the same errors and warnings that the policy summary reports. You can then view the changes in the policy summary to confirm that you fixed all of the issues. To learn how to edit an inline policy, see the section called “Edit IAM policies”. You cannot edit AWS managed policies.

You can edit a policy for your policy summary using the **Visual** option.

To edit a policy for your policy summary using the Visual option

1. Open the policy summary as explained in the previous procedures.
2. Choose **Edit**.

If you are on the **Users** page and choose to edit a customer managed policy that is attached to that user, you are redirected to the **Policies** page. You can edit customer managed policies only on the **Policies** page.

3. Choose the **Visual** option to view the editable visual representation of your policy. IAM might restructure your policy to optimize it for the visual editor and to make it easier for you to find and fix any problems. The warnings and error messages on the page can guide you to fix any issues with your policy. For more information about how IAM restructures policies, see Policy restructuring.
4. Edit your policy and choose **Next** to see your changes reflected in the policy summary. If you still see a problem, choose **Previous** to return to the editing screen.
5. Choose **Save changes** to save your changes.

You can edit a policy for your policy summary using the **JSON** option.

To edit a policy for your policy summary using the JSON option

1. Open the policy summary as explained in the previous procedures.
2. You can use the **Summary** and **JSON** buttons to compare the policy summary to the JSON policy document. You can use this information to determine which lines in the policy document you want to change.
3. Choose **Edit** and then choose the **JSON** option to edit the JSON policy document.

> **Note**
>
> You can switch between the **Visual** and **JSON** editor options any time. However, if you make changes or choose **Next** in the **Visual** editor option, IAM might restructure your policy to optimize it for the visual editor. For more information, see Policy restructuring.

If you are on the **Users** page and choose to edit a customer managed policy that is attached to that user, you are redirected to the **Policies** page. You can edit customer managed policies only on the **Policies** page.

4. Edit your policy. Resolve any security warnings, errors, or general warnings generated during policy validation, and then choose **Next**. If you still see a problem, choose **Previous** to return to the editing screen.
5. Choose **Save changes** to save your changes.

Access levels in policy summaries

AWS access level summary

Policy summaries include an access level summary that describes the action permissions defined for each service that is mentioned in the policy. To learn about policy summaries, see Policy summaries. Access level summaries indicate whether the actions in each access level (`List`, `Read`, `Tagging`, `Write`, and `Permissions management`) have `Full` or `Limited` permissions defined in the policy. To view the access level classification that is assigned to each action in a service, see Actions, Resources, and Condition Keys for AWS Services.

The following example describes the access provided by a policy for the given services. For examples of full JSON policy documents and their related summaries, see Examples of policy summaries.

Service	Access level	This policy provides the following
IAM	Full access	Access to all actions within the IAM service.
CloudWatch	**Full:** List	Access to all CloudWatch actions in the `List` access level, but no access to actions with the `Read`, `Write`, or `Permissions management` access level classification.
Data Pipeline	**Limited:** List, Read	Access to at least one but not all AWS Data Pipeline actions in the `List` and `Read` access level, but not the `Write` or `Permissions management` actions.
EC2	**Full:** List, Read **Limited:** Write	Access to all Amazon EC2 `List` and `Read` actions and access to at least one but not all Amazon EC2 `Write` actions, but no access to

Service	Access level	This policy provides the following
		actions with the `Permissions management` access level classification.
S3	**Limited:** Read, Write, Permissions management	Access to at least one but not all Amazon S3 `Read`, `Write` and `Permissions management` actions.
codedploy	(empty)	Unknown access, because IAM does not recognize this service.
API Gateway	None	No access is defined in the policy.
CodeBuild	⚠ No actions are defined.	No access because no actions are defined for the service. To learn how to understand and troubleshoot this issue, see the section called "My policy does not grant the expected permissions".

In a policy summary, **Full access** indicates that the policy provides access to all the actions within the service. Policies that provide access to some but not all actions within a service are further grouped according to the access level classification. This is indicated by one of the following access-level groupings:

- **Full**: The policy provides access to all actions within the specified access level classification.
- **Limited**: The policy provides access to one or more but not all actions within the specified access level classification.
- **None**: The policy provides no access.
- (empty): IAM does not recognize this service. If the service name includes a typo, then the policy provides no access to the service. If the service name is correct, then the service might not support policy summaries or might be in preview. In this case, the policy might provide access, but that access cannot be shown in the policy summary. To request policy summary support for a generally available (GA) service, see Service does not support IAM policy summaries.

Access level summaries that include limited (partial) access to actions are grouped using the AWS access level classifications `List`, `Read`, `Tagging`, `Write`, or `Permissions management`.

AWS access levels

AWS defines the following access level classifications for the actions in a service:

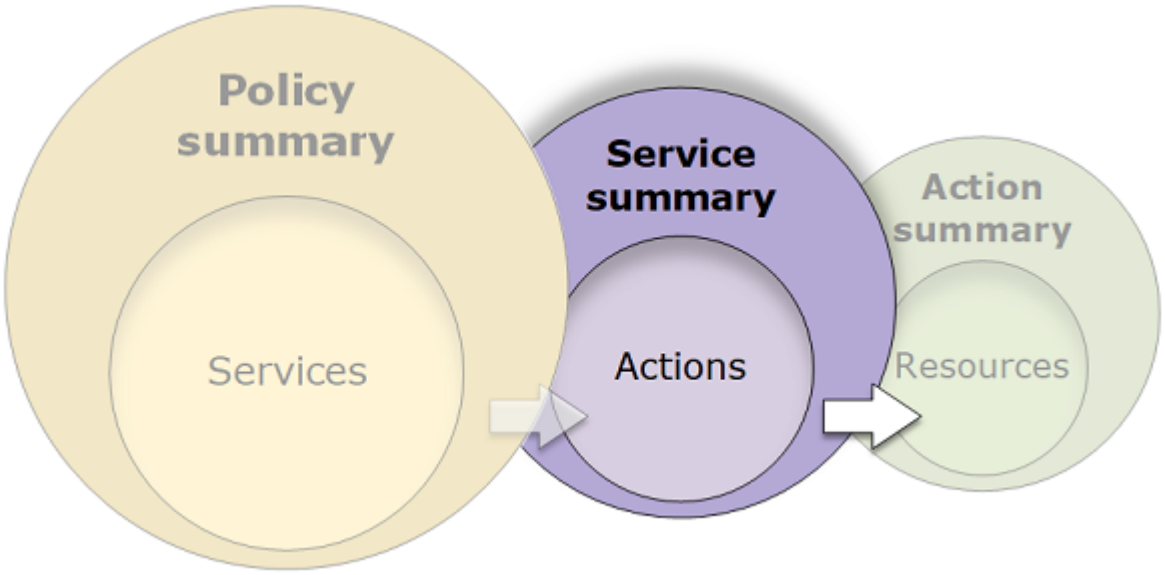
- **List**: Permission to list resources within the service to determine whether an object exists. Actions with this level of access can list objects but cannot see the contents of a resource. For example, the Amazon S3 action `ListBucket` has the **List** access level.
- **Read**: Permission to read but not edit the contents and attributes of resources in the service. For example, the Amazon S3 actions `GetObject` and `GetBucketLocation` have the **Read** access level.
- **Tagging**: Permission to perform actions that only change the state of resource tags. For example, the IAM actions `TagRole` and `UntagRole` have the **Tagging** access level because they allow only tagging or untagging a role. However, the `CreateRole` action allows tagging a role resource when you create that role. Because the action does not only add a tag, it has the `Write` access level.
- **Write**: Permission to create, delete, or modify resources in the service. For example, the Amazon S3 actions `CreateBucket`, `DeleteBucket` and `PutObject` have the **Write** access level. `Write` actions might also allow modifying a resource tag. However, an action that allows only changes to tags has the `Tagging` access level.
- **Permissions management**: Permissions management refers to actions that control access within AWS services, including IAM and non-IAM identity permissions, but excludes network-level access controls like security groups. For example, most IAM and AWS Organizations actions, as well as the Amazon S3 actions `PutBucketPolicy` and `DeleteBucketPolicy` have the **Permissions management** access level.

> **Tip**
>
> To improve the security of your AWS account, restrict or regularly monitor policies that include the **Permissions management** access level classification.

To view the access level classification for all of the actions in a service, see Actions, Resources, and Condition Keys for AWS Services.

Service summary (list of actions)

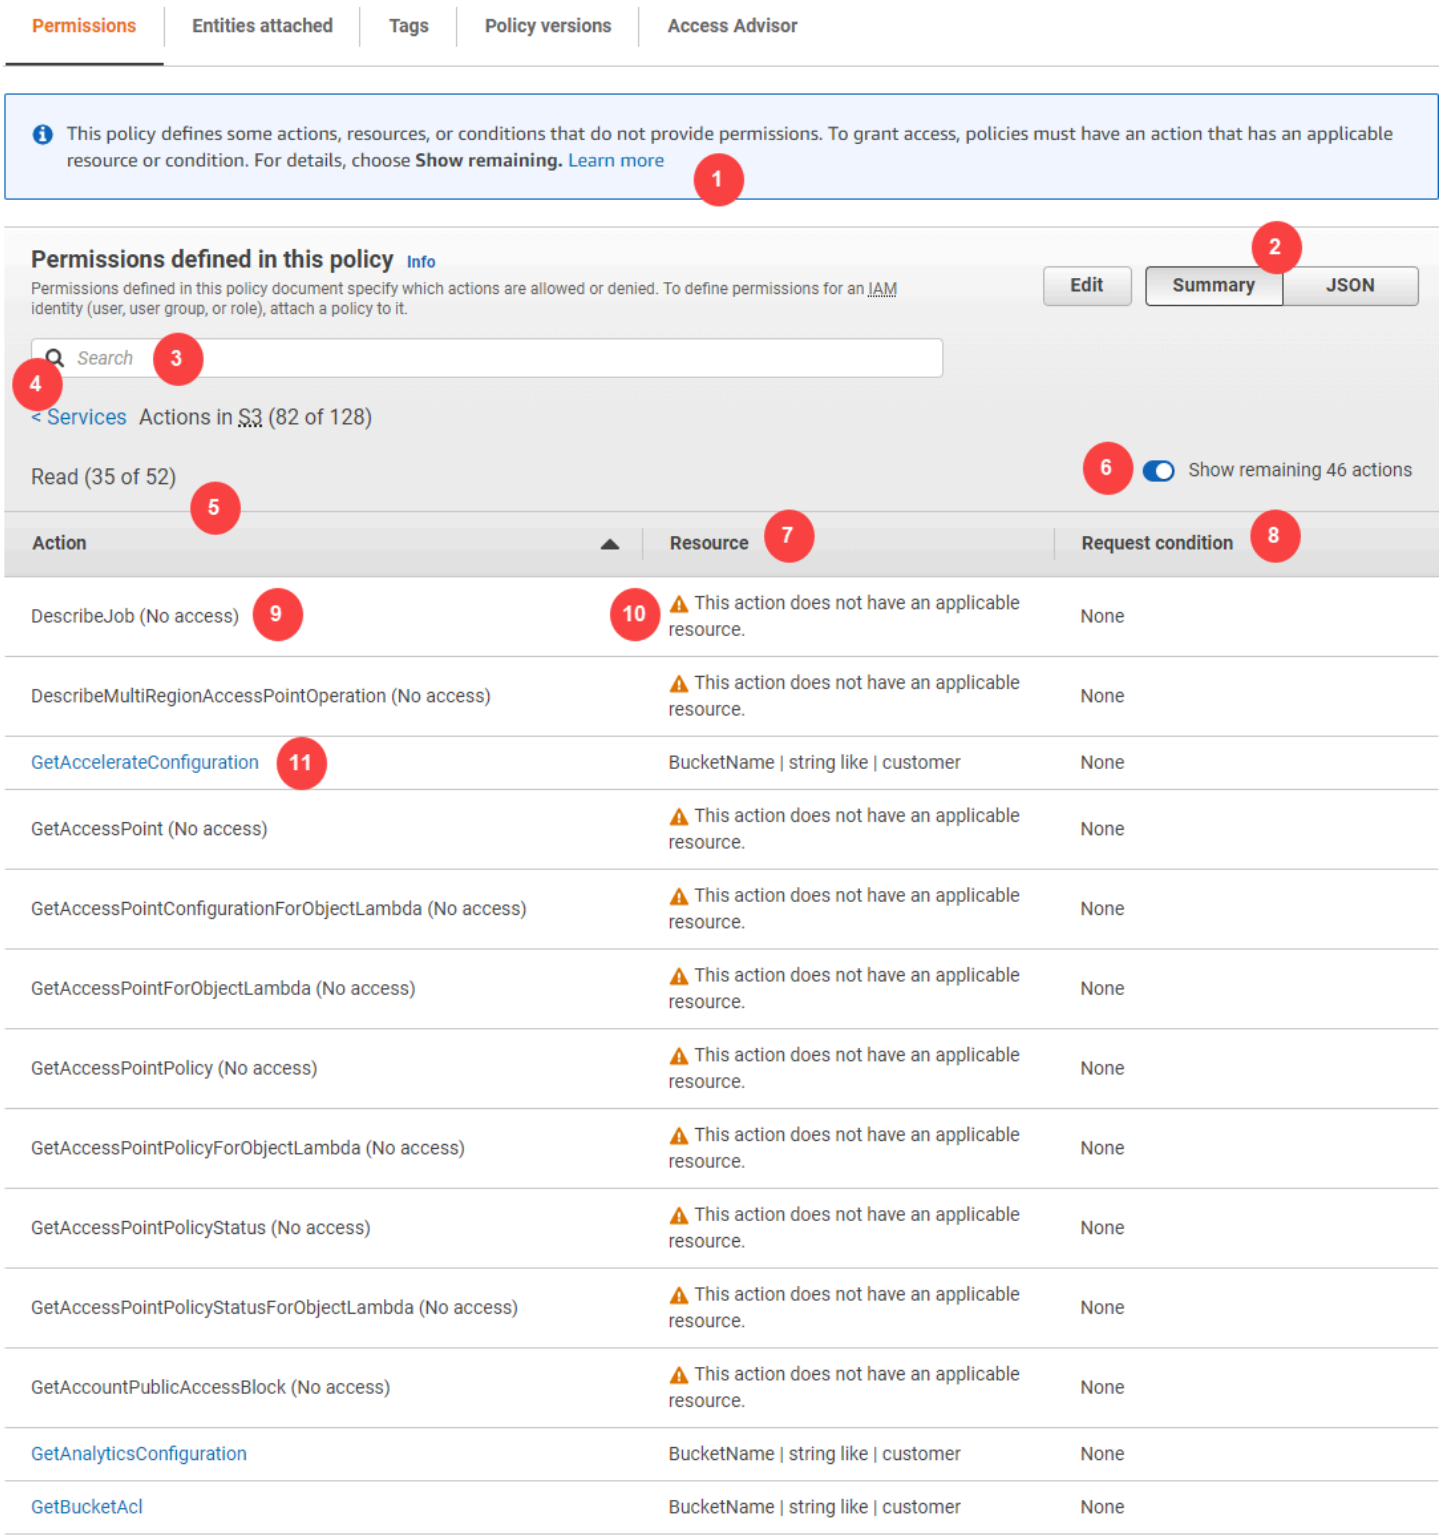
Policies are summarized in three tables: the policy summary, the service summary, and the action summary. The *service summary* table includes a list of the actions and summaries of the permissions that are defined by the policy for the chosen service.



You can view a service summary for each service listed in the policy summary that grants permissions. The table is grouped into **Uncategorized actions**, **Uncategorized resource types**, and access level sections. If the policy includes an action that IAM does not recognize, then the action is included in the **Uncategorized actions** section of the table. If IAM recognizes the action, then it is included under one of the access level (**List**, **Read**, **Write** and **Permissions management**) sections of the table. To view the access level classification that is assigned to each action in a service, see Actions, Resources, and Condition Keys for AWS Services.

Understanding the elements of a service summary

The example below is the service summary for Amazon S3 actions that are allowed from a policy summary. The actions for this service are grouped by access level. For example, 35 **Read** actions are defined out of the total 52 **Read** actions available for the service.



The service summary page for a managed policy includes the following information:

1. If the policy does not grant permissions to all the actions, resources, and conditions defined for the service in the policy, then a warning banner appears at the top of the page. The service

summary then includes details about the problem. To learn how policy summaries help you to understand and troubleshoot the permissions that your policy grants, see the section called "My policy does not grant the expected permissions".

2. Choose **JSON** to see additional details about the policy. You can do this to view all conditions that are applied to the actions. (If you are viewing the service summary for an inline policy that is attached directly to a user, you must close the service summary dialog box and return to the policy summary to access the JSON policy document.)
3. To view the summary for a specific action, type keywords into the **Search** box to reduce the list of available actions.
4. Next to the **Services** back arrow appears the name of the service (in this case **S3**). The service summary for this service includes the list of allowed or denied actions that are defined in the policy. If the service appears under **(Explicit deny)** on the **Permissions** tab, then the actions listed in the service summary table are explicitly denied. If the service appears under **Allow** on the **Permissions** tab, then the actions listed in the service summary table are allowed.
5. **Action** – This column lists the actions that are defined within the policy and provides the resources and conditions for each action. If the policy grants or denies permissions to the action, then the action name links to the *action summary* table. The table groups these actions into at least one or up to five sections, depending on the level of access that the policy allows or denies. The sections are **List**, **Read**, **Write**, **Permission Management**, and **Tagging**. The count indicates the number of recognized actions that provide permissions within each access level. The total is the number of known actions for the service. In this example, 35 actions provide permissions out of 52 total known Amazon S3 **Read** actions. To view the access level classification that is assigned to each action in a service, see Actions, Resources, and Condition Keys for AWS Services.
6. **Show remaining actions** – Toggle this button to expand or hide the table to include actions that are known but do not provide permissions for this service. Toggling the button also displays warnings for any elements that do not provide permissions.
7. **Resource** – This column shows the resources that the policy defines for the service. IAM does not check whether the resource applies to each action. In this example, actions in the Amazon S3 service are allowed on only the `developer_bucket` Amazon S3 bucket resource. Depending on the information that the service provides to IAM, you might see an ARN such as `arn:aws:s3:::developer_bucket/*`, or you might see the defined resource type, such as `BucketName = developer_bucket`.

> **Note**
>
> This column can include a resource from a different service. If the policy statement that includes the resource does not include both actions and resources from the same service, then your policy includes mismatched resources. IAM does not warn you about mismatched resources when you create a policy, or when you view a policy in the service summary. IAM also does not indicate whether the action applies to the resources, only whether the service matches. If this column includes a mismatched resource, then you should review your policy for errors. To better understand your policies, always test them with the policy simulator.

8. **Request condition** – This column tells whether the actions associated with the resource are subject to conditions. To learn more about those conditions, choose **JSON** to review the JSON policy document.
9. **(No access)** – This policy includes an action that does not provide permissions.
10. **Resource warning** – For actions with resources that do not provide full permissions, you see one of the following warnings:
    - **This action does not support resource-level permissions. This requires a wildcard (*) for the resource.** – This means that the policy includes resource-level permissions but must include `"Resource": ["*"]` to provide permissions for this action.
    - **This action does not have an applicable resource.** – This means that the action is included in the policy without a supported resource.
    - **This action does not have an applicable resource and condition.** – This means that the action is included in the policy without a supported resource and without a supported condition. In this case, there is also condition included in the policy for this service, but there are no conditions that apply to this action.
11. Actions that provide permissions include a link to the action summary.

View service summaries

You can view a service summary for each service listed in the policy summary that grants permissions.

Viewing service summaries from the Policies page

You can view the service summary for managed policies on the **Policies** page.

To view the service summary for a managed policy

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane, choose **Policies**.
3. In the list of policies, choose the name of the policy that you want to view.
4. On the **Policy details** page for the policy, view the **Permissions** tab to see the policy summary.
5. In the policy summary list of services, choose the name of the service that you want to view.

Viewing a service summary for a policy attached to a user

You can view the service summary for any policies that are attached to an IAM user.

To view the service summary for a policy attached to a user

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane, choose **Users**.
3. In the list of users, choose the name of the user whose policy you want to view.
4. On the **Summary** page for the user, view the **Permissions** tab to see the list of policies that are attached to the user directly or from a group.
5. In the table of policies for the user, choose the name of the policy that you want to view.

   If you are on the **Users** page and choose to view the service summary for a policy that is attached to that user, you are redirected to the **Policies** page. You can view service summaries only on the **Policies** page.
6. Choose **Summary**. In the policy summary list of services, choose the name of the service that you want to view.

> **Note**
>
> If the policy that you select is an inline policy that is attached directly to the user, then the service summary table appears. If the policy is an inline policy attached from a group, then you are taken to the JSON policy document for that group. If the policy is a managed policy, then you are taken to the service summary for that policy on the **Policies** page.

Viewing a service summary for a policy attached to a role

You can view the policy summary for any policies that are attached to a role.

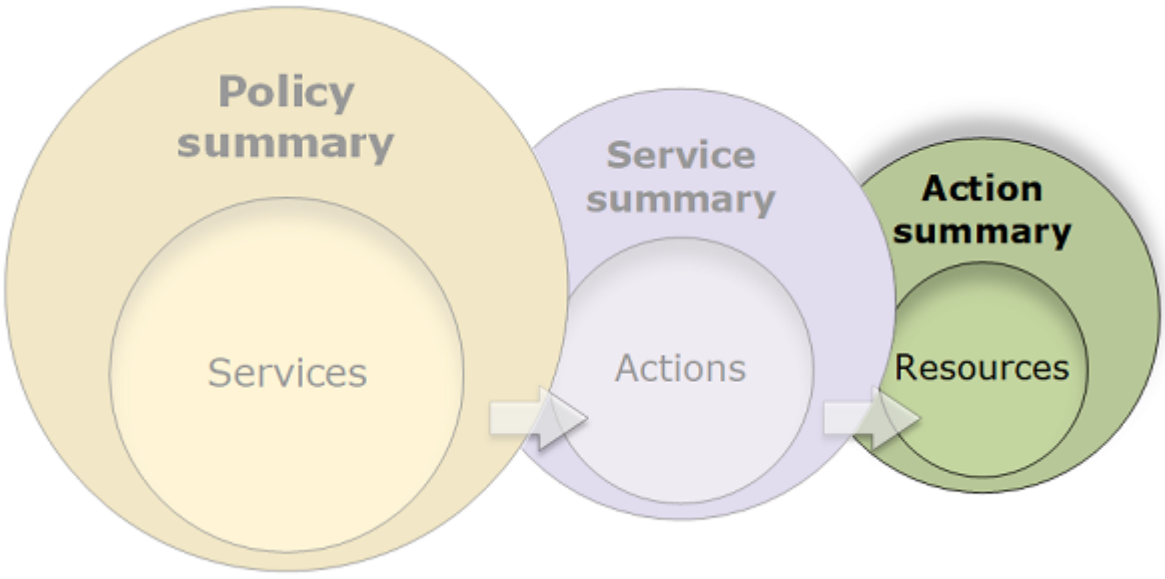
To view the service summary for a policy attached to a role

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. Choose **Roles** from the navigation pane.
3. In the list of roles, choose the name of the role whose policy you want to view.
4. On the **Summary** page for the role, view the **Permissions** tab to see the list of policies that are attached to the role.
5. In the table of policies for the role, choose the name of the policy that you want to view.

   If you are on the **Roles** page and choose to view the service summary for a policy that is attached to that user, you are redirected to the **Policies** page. You can view service summaries only on the **Policies** page.
6. In the policy summary list of services, choose the name of the service that you want to view.

Action summary (list of resources)

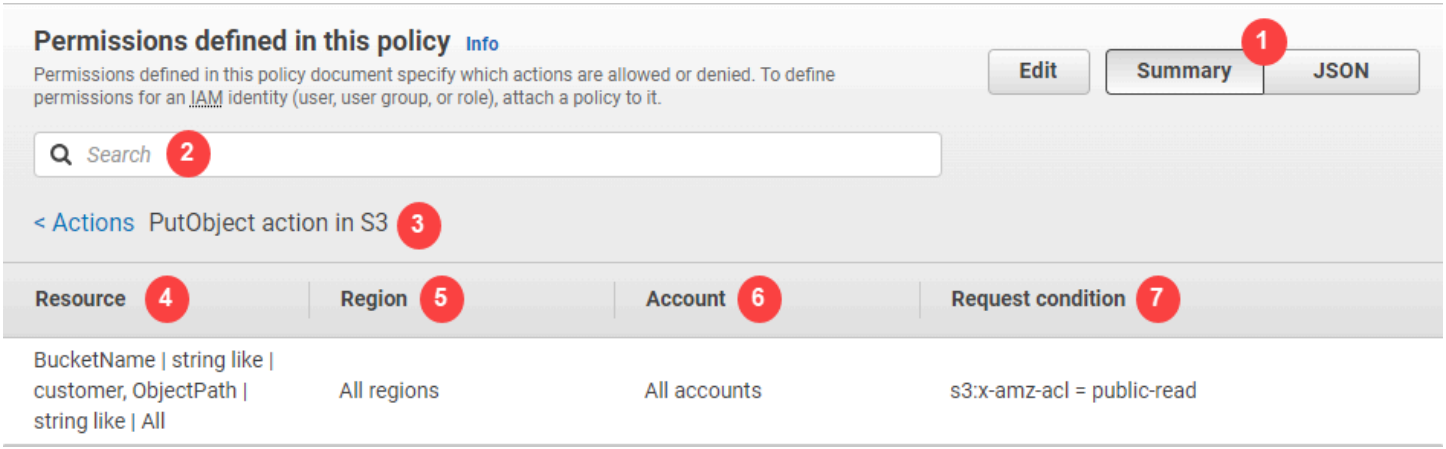
Policies are summarized in three tables: the policy summary, the service summary, and the action summary. The *action summary* table includes a list of resources and the associated conditions that apply to the chosen action.



To view an action summary for each action that grants permissions, choose the link in the service summary. The action summary table includes details about the resource, including its **Region** and **Account**. You can also view the conditions that apply to each resource. This shows you conditions that apply to some resources but not others.

Understanding the elements of an action summary

The example below is the action summary for the `PutObject` (Write) action from the Amazon S3 service summary (see Service summary (list of actions)). For this action, the policy defines multiple conditions on a single resource.



The action summary page includes the following information:

1. Choose **JSON** to see additional details about the policy, such as viewing the multiple conditions that are applied to the actions. (If you are viewing the action summary for an inline policy that is attached directly to a user, the steps differ. To access the JSON policy document in that case, you must close the action summary dialog box and return to the policy summary.)
2. To view the summary for a specific resource, type keywords into the **Search** box to reduce the list of available resources.
3. Next to the **Actions** back arrow appears the name of the service and action in the format `action name action in service` (in this case **PutObject action in S3**). The action summary for this service includes the list of resources that are defined in the policy.
4. **Resource** – This column lists the resources that the policy defines for the chosen service. In this example, the **PutObject** action is allowed on all object paths, but on only the `developer_bucket` Amazon S3 bucket resource. Depending on the information that the service provides to IAM, you might see an ARN such as `arn:aws:s3:::developer_bucket/`

*, or you might see the defined resource type, such as `BucketName = developer_bucket, ObjectPath = All`.

5. **Region** – This column shows the Region in which the resource is defined. Resources can be defined for all Regions, or a single Region. They cannot exist in more than one specific Region.
   - **All regions** – The actions that are associated with the resource apply to all Regions. In this example, the action belongs to a global service, Amazon S3. Actions that belong to global services apply to all Regions.
   - Region text – The actions associated with the resource apply to one Region. For example, a policy can specify the `us-east-2` Region for a resource.
6. **Account** – This column indicates whether the services or actions associated with the resource apply to a specific account. Resources can exist in all accounts or a single account. They cannot exist in more than one specific account.
   - **All accounts** – The actions that are associated with the resource apply to all accounts. In this example, the action belongs to a global service, Amazon S3. Actions that belong to global services apply to all accounts.
   - **This account** – The actions that are associated with the resource apply only in the current account..
   - Account number – The actions that are associated with the resource apply to one account (one that you are not currently logged in to). For example, if a policy specifies the `123456789012` account for a resource, then the account number appears in the policy summary.
7. **Request condition** – This column shows whether the actions that are associated with the resource are subject to conditions. This example includes the `s3:x-amz-acl = public-read` condition. To learn more about those conditions, choose **JSON** to review the JSON policy document.

View action summaries

You can view an action summary for each action listed in the policy summary that grants permissions.

Viewing action summaries from the Policies page

You can view the action summary for managed policies.

To view the action summary for a managed policy

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane, choose **Policies**.
3. In the list of policies, choose the name of the policy that you want to view.
4. On the **Policy details** page for the policy, view the **Permissions** tab to see the policy summary.
5. In the policy summary list of services, choose the name of the service that you want to view.
6. In the service summary list of actions, choose the name of the action that you want to view.

Viewing action summaries for a policy attached to a user

You can view the action summary for any policy that is attached to a user.

To view the action summary for a policy attached to a user

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. Choose **Users** from the navigation pane.
3. In the list of users, choose the name of the user whose policy you want to view.
4. On the **Summary** page for the user, view the **Permissions** tab to see the list of policies that are attached to the user directly or from a group.
5. In the table of policies for the user, choose the name of the policy that you want to view.

   If you are on the **Users** page and choose to view the service summary for a policy that is attached to that user, you are redirected to the **Policies** page. You can view service summaries only on the **Policies** page.
6. In the policy summary list of services, choose the name of the service that you want to view.

> **Note**
>
> If the policy that you select is an inline policy that is attached directly to the user, then the service summary table appears. If the policy is an inline policy attached from a group, then you are taken to the JSON policy document for that group. If the policy is a managed policy, then you are taken to the service summary for that policy on the **Policies** page.

7. In the service summary list of actions, choose the name of the action that you want to view.

Viewing action summaries for a policy attached to a role

You can view the action summary for any policy that is attached to a role.

To view the action summary for a policy attached to a role

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane, choose **Roles**.
3. In the list of roles, choose the name of the role whose policy you want to view.
4. On the **Summary** page for the role, view the **Permissions** tab to see the list of policies that are attached to the role.
5. In the table of policies for the role, choose the name of the policy that you want to view.

   If you are on the **Roles** page and choose to view the service summary for a policy that is attached to that user, you are redirected to the **Policies** page. You can view service summaries only on the **Policies** page.
6. In the policy summary list of services, choose the name of the service that you want to view.
7. In the service summary list of actions, choose the name of the action that you want to view.

Examples of policy summaries

The following examples include JSON policies with their associated policy summaries, the service summaries, and the action summaries to help you understand the permissions given through a policy.

Policy 1: DenyCustomerBucket

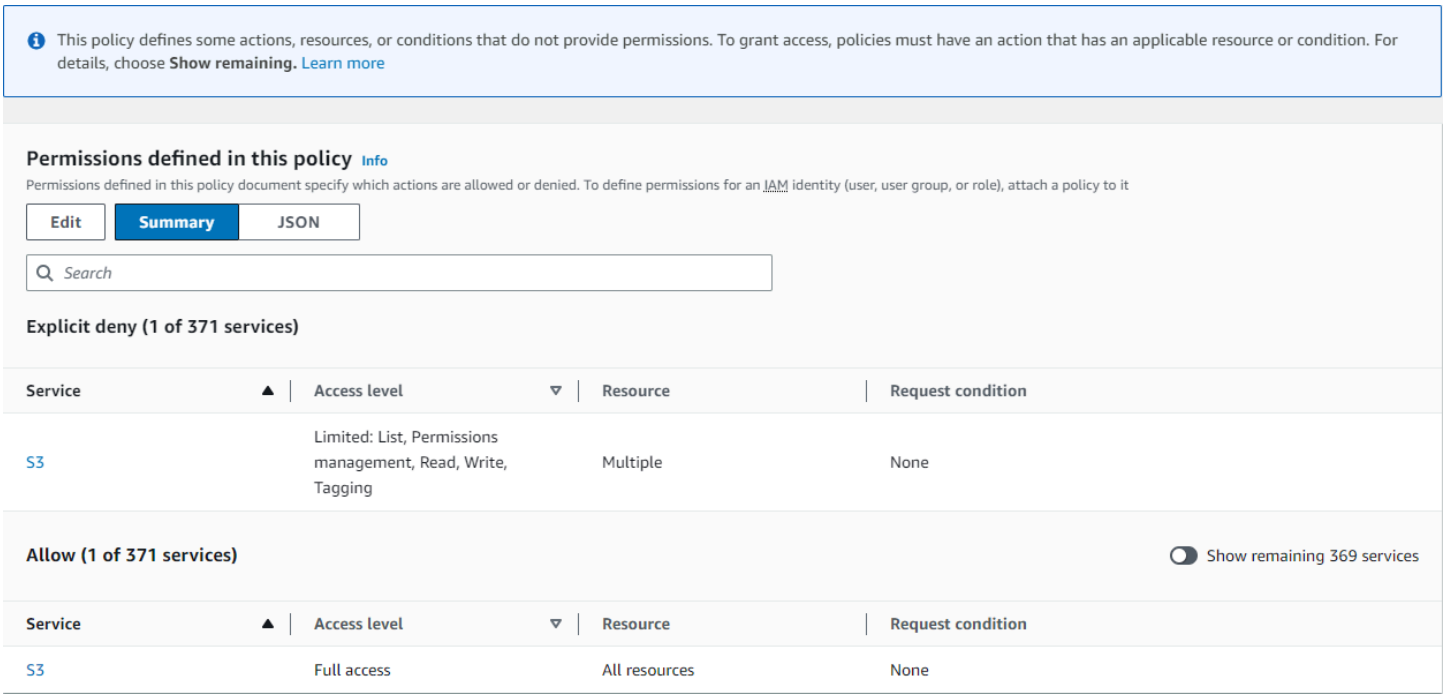
This policy demonstrates an allow and a deny for the same service.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
```

```
        {
            "Sid": "FullAccess",
            "Effect": "Allow",
            "Action": ["s3:*"],
            "Resource": ["*"]
        },
        {
            "Sid": "DenyCustomerBucket",
            "Action": ["s3:*"],
            "Effect": "Deny",
            "Resource": ["arn:aws:s3:::customer", "arn:aws:s3:::customer/*" ]
        }
    ]
}
```

***DenyCustomerBucket** Policy Summary:*



***DenyCustomerBucket S3 (Explicit deny)** Service Summary:*

< Services Actions in S3 (82 of 130) Show remaining 48 actions

Read (35 of 53)

Action	Resource	Request condition
GetAccelerateConfiguration	BucketName| string like |customer	None
GetAnalyticsConfiguration	BucketName| string like |customer	None
GetBucketAcl	BucketName| string like |customer	None
GetBucketCORS	BucketName| string like |customer	None
GetBucketLocation	BucketName| string like |customer	None
GetBucketLogging	BucketName| string like |customer	None
GetBucketNotification	BucketName| string like |customer	None
GetBucketObjectLockConfiguration	BucketName| string like |customer	None
GetBucketOwnershipControls	BucketName| string like |customer	None
GetBucketPolicy	BucketName| string like |customer	None
GetBucketPolicyStatus	BucketName| string like |customer	None
GetBucketPublicAccessBlock	BucketName| string like |customer	None
GetBucketRequestPayment	BucketName| string like |customer	None
GetBucketTagging	BucketName| string like |customer	None
GetBucketVersioning	BucketName| string like |customer	None
GetBucketWebsite	BucketName| string like |customer	None

***GetObject (Read)** Action Summary:*

< Actions GetObject action in S3

Resource	Region	Account	Request condition
BucketName| string like |customer, ObjectPath| string like |All	-	All accounts	None

Policy 2: DynamoDbRowCognitoID

This policy provides row-level access to Amazon DynamoDB based on the user's Amazon Cognito ID.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "dynamodb:DeleteItem",
                "dynamodb:GetItem",
                "dynamodb:PutItem",

Permissions required to access IAM resources

Resources are objects within a service. IAM resources include groups, users, roles, and policies. If you are signed in with AWS account root user credentials, you have no restrictions on administering IAM credentials or IAM resources. However, IAM users must explicitly be given permissions to administer credentials or IAM resources. You can do this by attaching an identity-based policy to the user.

> **Note**
>
> Throughout the AWS documentation, when we refer to an IAM policy without mentioning any of the specific categories, we mean an identity-based, customer managed policy. For details about policy categories, see the section called “Policies and permissions”.

Permissions for administering IAM identities

The permissions that are required to administer IAM groups, users, roles, and credentials usually correspond to the API actions for the task. For example, in order to create IAM users, you must have the `iam:CreateUser` permission that has the corresponding API command: `CreateUser`. To allow an IAM user to create other IAM users, you could attach an IAM policy like the following one to that user:

JSON

```
{
  "Version":"2012-10-17",
  "Statement": {
    "Effect": "Allow",
    "Action": "iam:CreateUser",
    "Resource": "*"
  }
}
```

In a policy, the value of the `Resource` element depends on the action and what resources the action can affect. In the preceding example, the policy allows a user to create any user (* is a wildcard that matches all strings). In contrast, a policy that allows users to change only their own access keys (API actions `CreateAccessKey` and `UpdateAccessKey`) typically has a `Resource`

element. In this case the ARN includes a variable (`${aws:username}`) that resolves to the current user's name, as in the following example:

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "ListUsersForConsole",
            "Effect": "Allow",
            "Action": "iam:ListUsers",
            "Resource": "arn:aws:iam::*:*"
        },
        {
            "Sid": "ViewAndUpdateAccessKeys",
            "Effect": "Allow",
            "Action": [
                "iam:UpdateAccessKey",
                "iam:CreateAccessKey",
                "iam:ListAccessKeys"
            ],
            "Resource": "arn:aws:iam::*:user/${aws:username}"
        }
    ]
}
```

In the previous example, `${aws:username}` is a variable that resolves to the user name of the current user. For more information about policy variables, see IAM policy elements: Variables and tags.

Using a wildcard character (*) in the action name often makes it easier to grant permissions for all the actions related to a specific task. For example, to allow users to perform any IAM action, you can use `iam:*` for the action. To allow users to perform any action related just to access keys, you can use `iam:*AccessKey*` in the `Action` element of a policy statement. This gives the user permission to perform the `CreateAccessKey`, `DeleteAccessKey`, `GetAccessKeyLastUsed`, `ListAccessKeys`, and `UpdateAccessKey` actions. (If an action is added to IAM in the future that has "AccessKey" in the name, using `iam:*AccessKey*` for the `Action` element will also give the user permission to that new action.) The following example shows a policy that allows users

to perform all actions pertaining to their own access keys (replace *account-id* with your AWS account ID):

JSON

```
{
    "Version":"2012-10-17",
    "Statement": {
        "Effect": "Allow",
        "Action": "iam:*AccessKey*",
        "Resource": "arn:aws:iam::111122223333:user/${aws:username}"
    }
}
```

Some tasks, such as deleting a group, involve multiple actions: You must first remove users from the group, then detach or delete the group's policies, and then actually delete the group. If you want a user to be able to delete a group, you must be sure to give the user permissions to perform all of the related actions.

Permissions for working in the AWS Management Console

The preceding examples show policies that allow a user to perform the actions with the AWS CLI or the AWS SDKs.

As users work with the console, the console issues requests to IAM to list groups, users, roles, and policies, and to get the policies associated with a group, user, or role. The console also issues requests to get AWS account information and information about the principal. The principal is the user making requests in the console.

In general, to perform an action, you must have only the matching action included in a policy. To create a user, you need permission to call the `CreateUser` action. Often, when you use the console to perform an action, you must have permissions to display, list, get, or otherwise view resources in the console. This is necessary so that you can navigate through the console to make the specified action. For example, if user Jorge wants to use the console to change his own access keys, he goes to the IAM console and chooses **Users**. This action causes the console to make a `ListUsers` request. If Jorge doesn't have permission for the `iam:ListUsers` action, the console is denied access when it tries to list users. As a result, Jorge can't get to his own name and to his

own access keys, even if he has permissions for the `CreateAccessKey` and `UpdateAccessKey` actions.

If you want to give users permissions to administer groups, users, roles, policies, and credentials with the AWS Management Console, you need to include permissions for the actions that the console performs. For some examples of policies that you can use to grant a user for these permissions, see Example policies for administering IAM resources.

Grant permissions across AWS accounts

You can directly grant IAM users in your own account access to your resources. If users from another account need access to your resources, you can create an IAM role, which is an entity that includes permissions but that isn't associated with a specific user. Users from other accounts can then use the role and access resources according to the permissions you've assigned to the role. For more information, see Access for an IAM user in another AWS account that you own.

> **Note**
>
> Some services support resource-based policies as described in Identity-based policies and resource-based policies (such as Amazon S3, Amazon SNS, and Amazon SQS). For those services, an alternative to using roles is to attach a policy to the resource (bucket, topic, or queue) that you want to share. The resource-based policy can specify the AWS account that has permissions to access the resource.

Permissions for one service to access another

Many AWS services access other AWS services. For example, several AWS services—including Amazon EMR, Elastic Load Balancing, and Amazon EC2 Auto Scaling—manage Amazon EC2 instances. Other AWS services make use of Amazon S3 buckets, Amazon SNS topics, Amazon SQS queues, and so on.

The scenario for managing permissions in these cases varies by service. Here are some examples of how permissions are handled for different services:

- In Amazon EC2 Auto Scaling, users must have permission to use Auto Scaling, but don't need to be explicitly granted permission to manage Amazon EC2 instances.

- In AWS Data Pipeline, an IAM role determines what a pipeline can do; users need permission to assume the role. (For details, see Granting Permissions to Pipelines with IAM in the *AWS Data Pipeline Developer Guide*.)

For details about how to configure permissions properly so that an AWS service is able to accomplish the tasks you intend, refer to the documentation for the service you are calling. To learn how to create a role for a service, see Create a role to delegate permissions to an AWS service.

Configuring a service with an IAM role to work on your behalf

When you want to configure an AWS service to work on your behalf, you typically provide the ARN for an IAM role that defines what the service is allowed to do. AWS checks to ensure that you have permissions to pass a role to a service. For more information, see Grant a user permissions to pass a role to an AWS service.

Required actions

Actions are the things that you can do to a resource, such as viewing, creating, editing, and deleting that resource. Actions are defined by each AWS service.

To allow someone to perform an action, you must include the necessary actions in a policy that applies to the calling identity or the affected resource. In general, to provide the permission required to perform an action, you must include that action in your policy. For example, to create a user, you need add the CreateUser action to your policy.

In some cases, an action might require that you include additional related actions in your policy. For example, to provide permission for someone to create a directory in AWS Directory Service using the `ds:CreateDirectory` operation, you must include the following actions in their policy:

- `ds:CreateDirectory`
- `ec2:DescribeSubnets`
- `ec2:DescribeVpcs`
- `ec2:CreateSecurityGroup`
- `ec2:CreateNetworkInterface`
- `ec2:DescribeNetworkInterfaces`
- `ec2:AuthorizeSecurityGroupIngress`

- `ec2:AuthorizeSecurityGroupEgress`

When you create or edit a policy using the visual editor, you receive warnings and prompts to help you choose all of the required actions for your policy.

For more information about the permissions required to create a directory in AWS Directory Service, see Example 2: Allow a User to Create a Directory.

Example policies for administering IAM resources

Following are examples of IAM policies that allow users to perform tasks associated with managing IAM users, groups, and credentials. This includes policies that permit users manage their own passwords, access keys, and multi-factor authentication (MFA) devices.

For examples of policies that let users perform tasks with other AWS services, like Amazon S3, Amazon EC2, and DynamoDB, see Example IAM identity-based policies.

Topics

- Allow a user to list the account's groups, users, policies, and more for reporting purposes
- Allow a user to manage a group's membership
- Allow a user to manage IAM users
- Allow users to set account password policy
- Allow users to generate and retrieve IAM credential reports
- Allow all IAM actions (admin access)

Allow a user to list the account's groups, users, policies, and more for reporting purposes

The following policy allows the user to call any IAM action that starts with the string `Get` or `List`, and to generate reports. To view the example policy, see IAM: Allows read-only access to the IAM console.

Allow a user to manage a group's membership

The following policy allows the user to update the membership of the group called *MarketingGroup*. To view the example policy, see IAM: Allows managing a group's membership programmatically and in the console.

Allow a user to manage IAM users

The following policy allows a user to perform all the tasks associated with managing IAM users but not to perform actions on other entities, such as creating groups or policies. Allowed actions include these:

- Creating the user (the `CreateUser` action).
- Deleting the user. This task requires permissions to perform all of the following actions: `DeleteSigningCertificate`, `DeleteLoginProfile`, `RemoveUserFromGroup`, and `DeleteUser`.
- Listing users in the account and in groups (the `GetUser`, `ListUsers` and `ListGroupsForUser` actions).
- Listing and removing policies for the user (the `ListUserPolicies`, `ListAttachedUserPolicies`, `DetachUserPolicy`, `DeleteUserPolicy` actions)
- Renaming or changing the path for the user (the `UpdateUser` action). The `Resource` element must include an ARN that covers both the source path and the target path. For more information on paths, see Friendly names and paths.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "AllowUsersToPerformUserActions",
            "Effect": "Allow",
            "Action": [
                "iam:ListPolicies",
                "iam:GetPolicy",
                "iam:UpdateUser",
                "iam:AttachUserPolicy",
                "iam:ListEntitiesForPolicy",
                "iam:DeleteUserPolicy",
                "iam:DeleteUser",
                "iam:ListUserPolicies",
                "iam:CreateUser",
                "iam:RemoveUserFromGroup",
                "iam:AddUserToGroup",
```

```
                "iam:GetUserPolicy",
                "iam:ListGroupsForUser",
                "iam:PutUserPolicy",
                "iam:ListAttachedUserPolicies",
                "iam:ListUsers",
                "iam:GetUser",
                "iam:DetachUserPolicy"
            ],
            "Resource": "*"
        },
        {
            "Sid": "AllowUsersToSeeStatsOnIAMConsoleDashboard",
            "Effect": "Allow",
            "Action": [
                "iam:GetAccount*",
                "iam:ListAccount*"
            ],
            "Resource": "*"
        }
    ]
}
```

A number of the permissions included in the preceding policy allow the user to perform tasks in the AWS Management Console. Users who perform user-related tasks from the AWS CLI, the AWS SDKs, or the IAM HTTP query API only might not need certain permissions. For example, if users already know the ARN of policies to detach from a user, they do not need the `iam:ListAttachedUserPolicies` permission. The exact list of permissions that a user requires depends on the tasks that the user must perform while managing other users.

The following permissions in the policy allow access to user tasks via the AWS Management Console:

- `iam:GetAccount*`
- `iam:ListAccount*`

Allow users to set account password policy

You might give some users permissions to get and update the password policy of your AWS account. To view the example policy, see IAM: Allows setting the account password requirements programmatically and in the console.

Allow users to generate and retrieve IAM credential reports

You can give users permission to generate and download a report that lists all users in your AWS account. The report also lists the status of various user credentials, including passwords, access keys, MFA devices, and signing certificates. For more information about credential reports, see Generate credential reports for your AWS account. To view the example policy, see IAM: Generate and retrieve IAM credential reports.

Allow all IAM actions (admin access)

You might give some users administrative permissions to perform all actions in IAM, including managing passwords, access keys, MFA devices, and user certificates. The following example policy grants these permissions.

> **Warning**
>
> When you give a user full access to IAM, there is no limit to the permissions that user can grant to him/herself or others. The user can create new IAM entities (users or roles) and grant those entities full access to all resources in your AWS account. When you give a user full access to IAM, you are effectively giving them full access to all resources in your AWS account. This includes access to delete all resources. You should grant these permissions to only trusted administrators, and you should enforce multi-factor authentication (MFA) for these administrators.

JSON

```
{
  "Version":"2012-10-17",
  "Statement": {
    "Effect": "Allow",
    "Action": "iam:*",
    "Resource": "*"
  }
}
```

IAM temporary delegation

Overview

Temporary delegation accelerates onboarding and simplifies management for products from Amazon and AWS Partners that integrate with your AWS accounts. Instead of manually configuring multiple AWS services, you can delegate temporary, limited permissions that allow the product provider to complete setup tasks on your behalf in minutes through automated deployment workflows. You maintain administrative control with approval requirements and permission boundaries, while product provider permissions automatically expire after the approved duration with no manual cleanup required. If the product requires persistent access for ongoing operations, the provider can use temporary delegation to create an IAM role with a permission boundary that defines the role's maximum permissions. All product provider activity is tracked through AWS CloudTrail for compliance and security monitoring.

To work with temporary delegation requests, you can initiate a request and review requests. For more information about monitoring, see notifications and CloudTrail logging.

> **Note**
>
> Temporary delegation requests can only be created by Amazon products and qualified AWS Partners that have completed the feature onboarding process. Customers review and approve these requests but cannot create them directly. If you are an AWS Partner looking to integrate IAM temporary delegation into your product, see the Partner Integration Guide for onboarding and integration instructions.

How temporary delegation works

Temporary delegation enables Amazon and AWS Partners to request temporary, limited access to your account. Upon your approval, they can use delegated permissions to take actions on your behalf. Delegation requests define specific permissions to AWS services and actions that the product provider needs to deploy or configure resources in your AWS account. These permissions are only available for a limited time and automatically expire after the duration specified in the request.

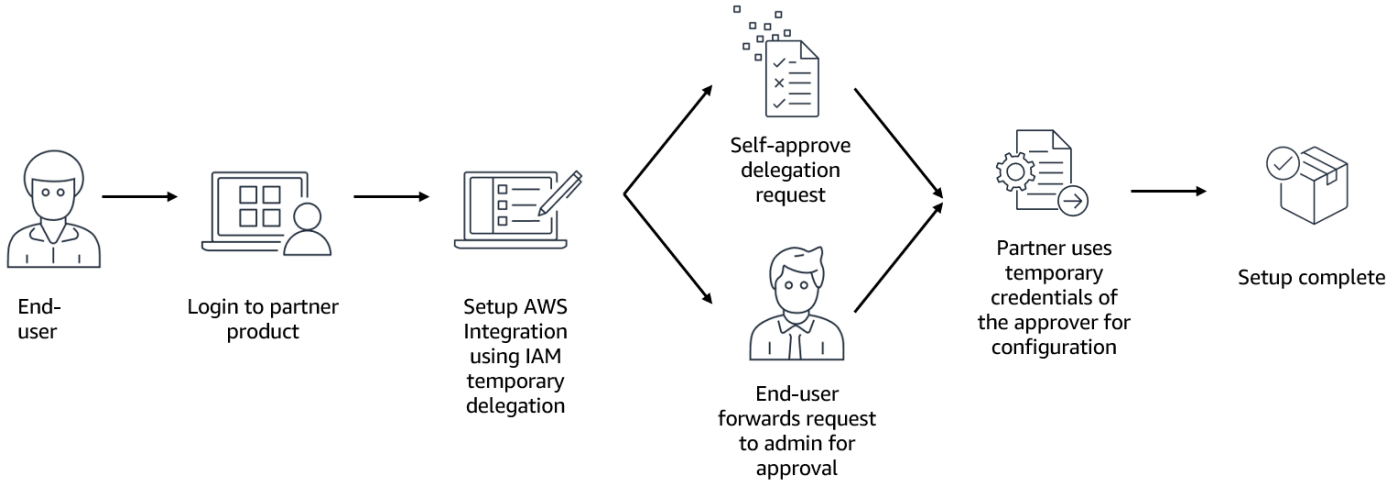
Note

The maximum duration for delegated access is 12 hours. However, root users can only approve delegation requests with a duration of 4 hours or less. If a request specifies more than 4 hours, you must use a non-root identity to approve the request. For details, see Permission simulation beta capability.

For ongoing tasks, such as reading from an Amazon S3 bucket, delegation requests can include the creation of an IAM role that allows continued access to resources and actions after the temporary access expires. Product providers must attach a permission boundary to any IAM role created through temporary delegation. Permission boundaries limit a role's maximum permissions but do not grant permissions on their own. You can review the permission boundary as part of the request before approving it. For details, see Permissions boundaries.

The process works as follows:

1. You log in to an Amazon or AWS Partner product to integrate it with your AWS environment.
2. The product provider initiates a delegation request on your behalf and redirects you to the AWS Management Console.
3. You review the requested permissions and determine whether to approve, deny, or forward the request to your administrator.
4. After you or your administrator approves the request, the product provider can obtain approver's temporary credentials to perform the required tasks.
5. Product provider access automatically expires after the specified time period. However, any IAM role created through the temporary delegation request persists beyond this period, allowing the product provider to continue accessing resources and actions for ongoing management tasks.



> **Note**
>
> You can only delegate permissions to a product provider if you have permissions to the services and actions included in the temporary delegation request. If you don't have access to the requested services and actions, the product provider does not receive these permissions when you approve the request.

If the permission check shows it is likely to succeed, you can approve the temporary delegation request and continue with the workflow.

If the permission check shows that you might not have sufficient permissions, forward the request to your administrator for approval. We recommend notifying your administrator about this request using your preferred method such as an email or a ticket.

After your administrator approves the request, what happens next depends on the product provider's configuration:

- If the product provider requested immediate access, they automatically receive temporary permissions and the access duration begins.
- If the product provider requested release by the owner (initial recipient), you must return to the request to explicitly share temporary account access before the access duration begins. Product providers typically use this option when they need additional input from you, such as resource selection or configuration details, to complete the required task.

Initiate a temporary delegation request

You can initiate a temporary delegation request only from supported Amazon or AWS Partner products. During a workflow that supports temporary delegation, you will be prompted to grant the product provider temporary, limited permissions to configure required AWS resources in your account. This automated approach provides a more streamlined experience by eliminating the need for you to configure these resources manually.

You can review delegation request details such as the specific IAM roles, policies, and AWS services the product provider needs before granting access. You can either approve the request yourself if you have sufficient permissions, or forward the request to your account administrator for approval. All product provider access is time-bounded and can be monitored and revoked as needed.

To initiate a temporary delegation request

1. Navigate to the console of a supported product from Amazon or AWS Partners that requires integration with your AWS account.
2. Select *Deploy with IAM temporary delegation*. Note that the option name might vary across supported products. Refer to the documentation of the product provider for details.

   > **Note**
   >
   > If you are not already signed in to the AWS Management Console, a new window opens to the AWS sign-in page. We recommend that you sign in to your AWS account before initiating the temporary delegation request from the product console. For more information about how to sign in based on your user type and the AWS resources that you want to access, see the AWS Sign-In User Guide.

3. Review the request details to confirm the product provider's product name and AWS account. You can also review the AWS identity that the product provider will use to perform actions on your behalf.
4. Review the *Access details* for the permissions that will be temporarily delegated by approving this request.

   - The *Permissions summary* section provides a high-level overview generated by AI that can help you understand what categories of AWS services can be accessed and what types of actions can be performed in each service.

- Choose *View JSON* to review specific permissions the product provider needs to deploy in your AWS account, including access scope and resource limitations.
- If the product provider creates an IAM role as part of a temporary delegation request, a permission boundary must be attached to the role. These IAM roles have permissions that continue to allow access to resources and actions after the requested access duration expires. Choose *View details* to review the permission boundary, which defines the maximum permissions that the role can have. The product provider will apply additional policies to the role during creation that define its actual permissions. These policies might appear more narrowly focused, or broader, than the boundary depending on how the product provider defines them. However, the permission boundary guarantees that the role's effective permissions will never exceed what you see during request approval, regardless of what policies are attached to the role. For more information, see Permissions boundaries.

5. Review the permission simulation results. The permission simulation capability automatically evaluates your identity's permissions against those included in the request. Based on this analysis, a recommendation is displayed indicating whether to approve the request with your current identity or forward the request to an administrator. For details, see Permission simulation beta capability .
6. In the dialog, select how you would like to proceed.

   - Select *Allow access* when your identity has sufficient permissions to allow the product provider to perform onboarding procedures on your behalf. When you select this option, the product provider's access duration starts after you provide access.
   - Select *Request approval* if your identity doesn't have sufficient permissions to allow the product provider to perform onboarding procedures on your behalf. Then, choose *Create approval request*. When you select this option, a temporary delegation request link is created that you can share with your account administrator. Your administrator can access the AWS Management Console or use the access link to Review Temporary delegation requests to approve the request and share temporary access with the requestor.

> **Note**
>
> Granting product provider access requires two actions: accepting the delegation request (`AcceptDelegationRequest`) and releasing the exchange token (`SendDelegationToken`). The AWS Management Console performs both steps

automatically when you approve a request. If you use the AWS CLI or API, you must execute both steps separately.

Permission simulation capability -beta

When you receive a temporary delegation request, you can either approve it yourself or forward it to your account administrator for approval. You can only delegate permissions to a product provider if you have permissions to the services and actions included in the temporary delegation request. If you don't have access to the requested services and actions, the product provider won't receive those permissions even if they're included in the request.

For example, a temporary delegation request requires the ability to create an Amazon S3 bucket, start and stop instances in Amazon EC2, and assume an IAM role. The identity that approves the request can start and stop instances in Amazon EC2, and assume an IAM role, but does not have permission to create an Amazon S3 bucket. When this identity approves the request, the product provider is not able to create an Amazon S3 bucket even though these permissions were included in the temporary delegation request.

Since you can only delegate permissions that you already possess, it's crucial to evaluate whether you have the requested permissions before approving. The permission simulation beta capability helps with this evaluation by comparing your permissions against those included in the request. The assessment indicates whether you can approve the request with your current identity or need to forward it to an administrator. If the analysis cannot validate that you have sufficient permissions, forward the request to an administrator for review. This assessment is based on simulated permission analysis and might differ from your live AWS environment, so review requested permissions carefully before proceeding.

Next steps

After you initiate a temporary delegation request, you can manage and monitor the request through its lifecycle. The following procedures help you track, approve, and control temporary access:

- Review Temporary delegation requests – Monitor the status of your access requests, and view detailed information about requests to approve or deny temporary delegation requests.
- Revoke temporary delegation access – Immediately terminate active temporary delegation sessions before they expire naturally.

Review Temporary delegation requests

After initiating a temporary delegation request, you can monitor, approve, and reject requests in the IAM console. The Temporary delegation requests page provides a centralized view of all requests, including those that are pending approval, completed, or rejected. As an administrator, you can review these requests to grant product providers access to AWS resources or reject them based on your organization's security policies, business requirements, or compliance standards. This visibility helps you track the lifecycle of product provider access and maintain oversight of temporary permissions.

> **Note**
>
> You must have the iam:AcceptDelegationRequest permission to approve temporary delegation requests.

To approve a temporary delegation request

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane on the left, choose *Temporary delegation requests*.
3. The main page displays a list of your temporary delegation requests with the following information:
   - *Request ID* – Unique identifier for the request
   - *Status* – Current status (Pending, Approved, Rejected, Shared, Expired)
   - *Requestor* - Product provider associated with the request
   - *Initiated by* - IAM principal in the account who initiated the request for the product provider
   - *Request created*– When the request was submitted
   - *Request expires* – When the request expired or will expire
4. (Optional) Use the filter options to view requests by status:
   - *All requests* – View all your requests regardless of status
   - *Pending* – View requests awaiting administrator approval
   - *Approved* – View approved requests
   - *Shared* – View requests for which access has been shared

- *Rejected* – View rejected requests with rejection reasons

5. To view detailed information about a specific request or to review a pending request for approval, choose the request ID.
6. Review the detailed request information:
   - Product provider information
   - Request reason and justification
   - Requested duration
   - Requested AWS permissions
7. If you are an administrator reviewing a pending request, choose one of the following options:
   - To approve the request, choose *Approve*. In the approval dialog, you can view the results of the permission simulation. For more information, see Permission simulation beta capability. After confirming access duration and your AWS identity, choose *Approve* to grant access. If the product provider requested immediate access, they automatically receive temporary permissions and the access duration begins. Otherwise, notify the person who initiated the request to release access to the product provider.
   - To reject the request, choose *Reject*.
     - In the rejection dialog, provide a clear reason for the rejection to help the requester understand why their request was denied.
     - Choose *Reject* to deny access.
8. The request list automatically refreshes to show the most current status information. You can also manually refresh the page to check for status updates.

Revoke Temporary delegation access

Although product provider access sessions are designed to expire automatically after their approved duration, you might need to terminate access immediately in certain situations. Revoking active product provider access provides an emergency control mechanism when security concerns arise, when the product provider's work is completed early, or when business requirements change. Both request initiators and administrators can revoke access to maintain security and operational control.

To revoke temporary delegation access

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane on the left, choose *Temporary delegation requests*.
3. Locate the request ID for the access session you want to revoke.
4. Choose *Actions* and then choose *Revoke access*.
5. In the dialog, choose *Revoke access* to confirm that you want to immediately terminate the access session.

After revoking access, the product provider will no longer be able to access your AWS resources. The revocation is logged in AWS CloudTrail for audit purposes.

> **Important**
>
> Revoking access immediately terminates the product provider access session. Any ongoing work or processes using the access will be interrupted. Make sure that revocation won't disrupt critical operations.

> **Note**
>
> You cannot revoke access for requests that were approved using a root user. AWS recommends that you avoid using a root user to approve delegation requests. Use an IAM role with appropriate permissions instead.

Managing Permissions for Delegation Requests

Administrators can grant IAM principals permissions to manage delegation requests from product providers. This is useful when you want to delegate approval authority to specific users or teams in your organization, or when you need to control who can perform specific actions on delegation requests.

The following IAM permissions are available for managing delegation requests:

Permission	Description
iam:AssociateDelegationRequest	Associate an unassigned delegation request with your AWS account
iam:GetDelegationRequest	View details of a delegation request
iam:UpdateDelegationRequest	Forward a delegation request to an administrator for approval
iam:AcceptDelegationRequest	Approve a delegation request
iam:SendDelegationToken	Release the exchange token to the product provider after approval
iam:RejectDelegationRequest	Reject a delegation request
iam:ListDelegationRequests	List delegation requests for your account

Note

By default, IAM principals who initiate a delegation request are automatically granted permissions to manage that specific request. They can associate it with their account, view request details, reject a request, forward it to an administrator for approval, release the exchange token to the product provider after admin approval, and list delegation requests that they own.

Notifications

IAM temporary delegation integrates with AWS User Notifications to help you stay informed about delegation request state changes. Notifications are particularly useful for administrators who need to review and approve delegation requests.

With AWS User Notifications, you can configure alerts to be delivered through multiple channels, including email, Amazon Simple Notification Service (SNS), AWS Chatbot for Slack or Microsoft Teams, and AWS Console Mobile Application. This ensures that the right people are notified at the right time, enabling faster response to pending approvals or awareness of access changes. You can also customize which events trigger notifications based on your organization's needs and security requirements.

Available Notification Events

You can subscribe to receive notifications for the following IAM temporary delegation events:

- IAM Temporary Delegation Request Created
- IAM Temporary Delegation Request Assigned
- IAM Temporary Delegation Request Pending Approval
- IAM Temporary Delegation Request Rejected
- IAM Temporary Delegation Request Accepted
- IAM Temporary Delegation Request Finalized
- IAM Temporary Delegation Request Expired

Configuring Notifications

To configure notifications for IAM temporary delegation events:

1. Open the AWS User Notifications console
2. Create or update a notification configuration
3. Select AWS IAM as the service
4. Choose which delegation request events you want to be notified about
5. Configure your delivery channels (email, AWS Chatbot, etc.)

For detailed instructions on configuring AWS User Notifications, including setting up delivery channels and managing notification rules, see the AWS User Notifications documentation.

CloudTrail

All actions performed by product providers using temporary delegated access are automatically logged in AWS CloudTrail. This provides complete visibility and auditability of product provider

activity in your AWS account. You can identify which actions were taken by product providers, when they occurred, and which product provider account performed them.

To help you distinguish between actions taken by your own IAM principals and those taken by product providers with delegated access, CloudTrail events include a new field called `invokedByDelegate` under the `userIdentity` element. This field contains the AWS account ID of the product provider, making it easy to filter and audit all delegated actions.

CloudTrail Event Structure

The following example shows a CloudTrail event for an action performed by a product provider using temporary delegated access:

```
{
    "eventVersion": "1.09",
    "userIdentity": {
        "type": "AssumedRole",
        "principalId": "AIDACKCEVSQ6C2EXAMPLE:Role-Session-Name",
        "arn": "arn:aws:sts::111122223333:assumed-role/Role-Name/Role-Session-Name",
        "accountId": "111122223333",
        "accessKeyId": "[REDACTED:AWS_ACCESS_KEY]",
        "sessionContext": {
            "sessionIssuer": {
                "type": "Role",
                "principalId": "AIDACKCEVSQ6C2EXAMPLE",
                "arn": "arn:aws:iam::111122223333:role/Admin",
                "accountId": "111122223333",
                "userName": "Admin"
            },
            "attributes": {
                "creationDate": "2024-09-09T17:50:16Z",
                "mfaAuthenticated": "false"
            }
        },
        "invokedByDelegate": {
            "accountId": "444455556666"
        }
    },
    "eventTime": "2024-09-09T17:51:44Z",
    "eventSource": "iam.amazonaws.com",
    "eventName": "GetUserPolicy",
    "awsRegion": "us-east-1",
    "requestParameters": {
```

```
        "userName": "ExampleIAMUserName",
        "policyName": "ExamplePolicyName"
    },
    "eventType": "AwsApiCall",
    "recipientAccountId": "111122223333"
}
```

The `invokedByDelegate` field contains the AWS account ID of the product provider who performed the action using delegated access. In this example, account 444455556666 (the product provider) performed an action in account 111122223333 (the customer account).

IAM temporary delegation for AWS Partners

Overview

IAM temporary delegation enables AWS customers to seamlessly onboard and/or integrate AWS Partner products into their AWS environment through interactive, guided workflows. Customers can grant AWS Partners limited, temporary access to configure required AWS services, reducing onboarding friction and accelerating time to value.

To integrate temporary delegation into your product, learn about understanding your integration, review understanding permissions, and follow the policy evaluation guidelines. For sample IAM policies, see policy templates. When you are ready to implement, see building your integration.

IAM temporary delegation enables partners to:

- Streamline customer onboarding with automated resource provisioning
- Reduce integration complexity by eliminating manual configuration steps
- Build trust through transparent, customer-approved permissions
- Enable ongoing operations with long-term access patterns using permission boundaries

How it works

1. *Partner creates a delegation request* - Partners create a request specifying what permissions they need and for how long
2. *Customer reviews in AWS Console* - Customer sees exactly what permissions partner is requesting and why

3. *Customer approves* - Customer approves the request and releases an exchange token. The token is sent to partner on this specified SNS topic.
4. *Partner receives temporary credentials* - Partners exchange the token for temporary AWS credentials
5. *Partner configures resources* - Partners use the credentials to set up required resources in the customer's account

Partner qualification

To qualify for temporary delegation integration, a partner must meet the following requirements:

- *ISV Accelerate participation* – You must be enrolled in the ISV Accelerate (ISVA) program.
- *AWS Marketplace listing* – Your product must be listed in the AWS Marketplace with a "Deployed on AWS" badge.

Onboarding process

Complete the following steps to integrate temporary delegation into your product:

1. *Step 1: Review requirements*

   Review this documentation to understand the qualification requirements and complete the partner questionnaire below.
2. *Step 2: Submit your onboarding request*

   Send an email to aws-iam-partner-onboarding@amazon.com or contact your AWS representative. Include your completed partner questionnaire with all required fields from the table below.
3. *Step 3: AWS validation and review*

   AWS will:

   - Validate that you meet the qualification criteria
   - Review your policy templates and permission boundaries
   - Provide feedback on your submitted artifacts
4. *Step 4: Refine your policies*

Respond to AWS feedback and submit updated policy templates or permission boundaries as needed.

5. *Step 5: Complete registration*

   After approval, AWS will:

   - Enable API access for your specified accounts
   - Share ARNs for your policy template and permissions boundary (if applicable)

   You will receive confirmation when onboarding is complete. You can then access temporary delegation APIs, CreateDelegationRequest and GetDelegatedAccessToken from your registered accounts and begin integrating delegation request workflows into your product.

Partner questionnaire

The following table lists the information required for partner onboarding:

Information	Description	Required
Partner Central AccountID	Account ID of your registered AWS account on AWS Partner Central.	Yes
PartnerId	Partner ID provided by AWS Partner Central.	No
AWS Marketplace Product Id	Product ID for your product provided by AWS Partner Central.	Yes
AWS accountIDs	The list of your AWS Account IDs that you want to use to call temporary delegation APIs. This should include both your production and non-production/test accounts.	Yes
Partner name	This name is displayed to customers in the AWS Management Console when they review your temporary delegation request.	Yes
Contact email(s)	One or more email addresses for contacting you about your integration.	Yes

Information	Description	Required
Requestor Domain	Your domain (for example, www.example.com)	Yes
Integration description	Brief description of the use case that you want to address using this feature. You can include reference links to your documentation or other public material.	Yes
Architecture diagram	Architecture diagram illustrating your integration use case(s).	No
Policy template	You must register at least one policy template for this feature. The policy template defines the temporary permissions you want to request in customers' AWS accounts. For more information, see Policy template section.	Yes
Policy template name	Name of the policy template you want to register.	Yes
Permissions Boundary	If you want to create IAM roles in customers' accounts using temporary permissions, you must register a permission boundary with IAM. Permission boundarie s will be attached to the IAM roles that you create to limit the maximum permissions on the role. You can use selected AWS managed policies as a permission boundary or register a new custom permission boundary (JSON). For more information, see Permissions Boundary section.	No
Permission Boundary Name	The name of your permission boundary. The format is: arn:aws:iam::partner:policy/permission_boundary/ <partner_domain>/<policy_name>_<date> The policy name must include the creation date as a suffix. The name cannot be updated after the permission boundary is created. If you are using an existing AWS managed policy, provide the managed policy ARN instead.	No

Information	Description	Required
Permissio n Boundary Description	Description for the permission boundary. This descripti on cannot be updated after the permission boundary is created.	No

Understanding your integration

After completing the onboarding process, you can build your integration with IAM temporary delegation. A complete integration typically involves three main categories of work:

1. User Experience and Workflow Design

Build a front-end experience in the partner application that guides customers through the temporary delegation workflow. Partner application should:

- Present a clear onboarding or configuration flow where customers can grant temporary access. Label this action clearly, such as "Deploy with IAM temporary delegation".
- Redirect customers to the AWS Management Console to review and approve the delegation request using the console link returned by the CreateDelegationRequest API
- Provide appropriate messaging about what permissions are being requested and why. Customers can see this message on the delegation request details page.
- Handle the customer's return to your application after they complete the approval in AWS.

Best Practices for Temporary Delegation Requests

When implementing temporary delegation for your partner application, follow the below defined best practices to help customers verify request authenticity and accuracy.

1. Include User-Identifiable Context in Request Messages

You should include user-specific context in delegation request message. This information helps users identify the requests from their existing partner workflow and distinguish legitimate requests. Suggested information in request message:

- Customer's account identifier or username in your service
- Workspace name, subscription ID, or organization identifier

- Specific resource being accessed (cluster name, project name, environment)
- Unique transaction or request identifier generated for this delegation attempt

Example request message:

```
Request from Partner A workspace "production-analytics"
Account: user@example.com
Workspace ID: 1234ABCD
Cluster: ml-training-cluster-01
Request ID: 1111-2222-3333-4444
```

2. Optional: Include AWS Account ID when Initiating Delegation

If the customer account ID is available, include it in the delegation request. This verification step creates an additional binding between the customer's intent and the delegation token.

3. Design Request Messages for Security Verification

Structure your request messages to enable customers to confidently verify legitimacy before granting access. User experience requirements:

- Display the request message prominently in your application interface before redirecting to AWS
- Use clear, descriptive language that connects directly to the customer's current action
- Avoid generic messages that could apply to any delegation request
- Include sufficient detail for customers to verify the request matches their intended workflow
- Display the AWS account ID that will receive delegated access
- Provide a clear explanation of what permissions your application will request

Include a confirmation notice in your application before redirecting customers to the AWS consent screen:

```
## Redirecting to IAM Temporary Delegation
You are about to grant [Your Service Name] temporary access to your AWS account.

Before clicking "Allow" on the AWS consent screen:
• Verify the request details match your current action
```

```
- Confirm the AWS account ID matches your intended account
- Make sure you initiated this request from [Your Service Name]
```

4. Session Binding Recommendations

While AWS IAM handles the core authorization flow, implement these practices in your application to strengthen session integrity:

- Generate unique, single-use request identifiers for each delegation attempt
- Associate delegation requests with the customer's active application session
- Implement appropriate request expiration depending on your delegation process
- Validate that delegation callbacks match the originating request context
- Log all delegation request initiations and completions for security monitoring

By following these best practices, you help create a more secure temporary delegation experience.

2. API Integration

Use IAM temporary delegation APIs to send and manage delegation requests. After your AWS accounts are registered, you can access the following APIs:

- *IAM CreateDelegationRequest* – Creates a delegation request for a customer's AWS account. This API returns a console link that you redirect customers to for reviewing and approving the request.
- *AWS STS GetDelegatedAccessToken* – Retrieves temporary AWS credentials after a customer approves your delegation request. Use these credentials to perform actions in the customer's account.

Your integration should handle the complete lifecycle of delegation requests, including creating requests, monitoring their status, and retrieving temporary credentials when approved.

3. Resource Configuration and Orchestration

After you obtain temporary credentials, orchestrate the necessary workflows to configure resources in the customer's AWS account. This might include:

- Calling AWS service APIs directly to create and configure resources

- Deploying infrastructure using AWS CloudFormation templates
- Creating IAM roles for ongoing access (requires using permission boundaries). As a defense-in-depth measure, we recommend that you use dynamic role names, for example, a name with a randomly generated suffix. This approach makes the role name in each customer account unique and unpredictable.

Your orchestration logic should be idempotent and handle failures gracefully, as customers might need to retry or modify their delegation approvals.

Understanding permissions

As part of the feature onboarding process, you will need to register policies with IAM that define the permissions you want to request in customers' AWS accounts. The registration process provides a more consistent experience for customers and helps avoid common pitfalls in policy authoring.

During registration, AWS evaluates your policies against a set of validations. These validations are intended to standardize policy formatting and structure, and provide basic protections against known anti-patterns. The validations also reduce the risk of privilege escalations, unintended cross-account access, and broad access to high-value resources in customer accounts.

Permission Types

AWS will consider two categories of permissions: temporary and long-term.

Temporary Permissions

Temporary permissions limit the permissions assigned to any temporary delegated access sessions. Temporary permissions are described in policy templates that are applied to the delegated session. The templates support parameters that you supply when you create a delegation request. These parameter values are then bound to the session. The temporary permissions work in the same way as the session policies available in AWS STS today: the policies limit the capability of the underlying user, but do not grant any additional access. For more information, see the AWS STS documentation on session policies.

Long-Term Permissions

Long-term permissions limit the permissions of any roles that are created or managed through temporary access. Long-term permissions are implemented as IAM permissions boundaries. You might submit one or more permission boundaries to AWS as part of onboarding. After approval, AWS will share a policy ARN with you that you can reference in your policies.

These boundary policies have two noteworthy features. First, they are immutable. If you want to update permissions, you can register a new permissions boundary. You can then attach the new permissions boundary to your customers' roles by sending a new delegation request. Second, the policies are not templated. Since the same boundary policy is globally shared, they cannot be altered on a per-customer basis.

> **Important**
>
> Permission boundaries have a maximum size limit of 6,144 characters.

> **Note**
>
> If you would like to update a permission boundary or policy template, contact IAM at aws-iam-partner-onboarding@amazon.com. After the new permission boundary is registered, you can then send a delegation request to customers to update the IAM role and attach the newly registered permission boundary. See the Examples section for more details.

Example Use Case: Data Processing Workload

Consider a product provider that runs a data processing workload in customer accounts. The provider needs to set up infrastructure during initial onboarding, but also requires ongoing access to operate the workload.

Temporary permissions (for initial setup):

- Create Amazon EC2 instances, VPC, and security groups
- Create an Amazon S3 bucket for processed data
- Create an IAM role for ongoing operations
- Attach a permission boundary to the IAM role

Long-term permissions (IAM role with permission boundary for ongoing operations):

- Start and stop Amazon EC2 instances to run processing jobs
- Read input data from Amazon S3 bucket
- Write processed results to Amazon S3 bucket

The temporary permissions are used once during onboarding to configure the infrastructure. The IAM role created during this process has a permission boundary that limits its maximum permissions to only the operations needed for ongoing workload management. This ensures that even if the role's policies are modified, it cannot exceed the permissions defined in the boundary.

Policy evaluation guidelines

AWS will evaluate your submitted policies against a set of guidelines. The same evaluation guidelines apply to both policy templates and permission boundaries, with minor differences noted where appropriate.

For the purposes of evaluation, services are separated into distinct groups. The most important distinction is for security-sensitive services, which manage access, credentials, and keys. Policies granting access to these services need to be focused narrowly on the work being done. Security-sensitive services include the following: AWS Identity and Access Management (IAM), AWS Key Management Service (KMS), AWS Resource Access Manager (RAM), AWS IAM Identity Center, AWS Organizations, and AWS Secrets Manager.

A secondary distinction is services that can access data across account boundaries. Policies for these services must include protections to prevent unintentional cross-account access.

Common validations

All policy statements must follow these guidelines:

- All statements must include Effect, Action (or NotAction), Resource, and Condition fields in that order
- All actions within a single statement must be listed alphabetically
- All ARNs included in the policy must follow the syntax defined in public documentation for the relevant services
- NotAction fields can only be used in Deny statements
- Actions in Allow statements must include a service code. Generic wildcards ("*") are not allowed

Security-sensitive service restrictions

The following restrictions apply to security-sensitive services mentioned above:

- Actions in Allow statements must be more specific than [service]:*

- Actions in Allow statements for temporary access policy templates must not contain wildcards
- Sensitive actions, such as iam:PassRole or iam:CreateServiceLinkedRole, require additional scoping, such as specific resources or conditional checks. These actions include:
  - IAM role passing
  - IAM role modification actions
  - IAM policy modification actions
  - AWS KMS write or cryptographic operations
  - AWS RAM write or share operations
  - AWS Secrets Manager operations for retrieving or modifying secrets, or modifying resource policies
- Other actions might use a wildcard resource, such as iam:ListUsers or iam:GetPolicy
- Actions that manage credentials, such as iam:CreateAccessKey, are blocked

IAM-specific restrictions

For IAM:

- Only limited write operations are allowed for IAM roles and policies. You can not request permissions on other IAM resources such as users, groups, and certificates.
- Policy attachment or inline policy management actions are limited to roles with a permission boundary. Permission boundaries must be partner-supplied or on a list of allowed AWS managed policies. AWS managed policies might be allowed if they do not grant highly privileged or administrative permissions. For example, AWS managed policies for specific job functions or the SecurityAudit policy might be acceptable. AWS will review each AWS managed policy on a case-by-case basis during the onboarding process.
- Policy management is only allowed for policies with a partner-specific path: arn:aws:iam::@{AccountId}:policy/partner_domain.com/[feature]*
- Tags might only be applied during resource creation, and only for roles and policies
- iam:PassRole checks must match a specific name or path prefix

AWS STS-specific restrictions

For AWS STS:

- sts:AssumeRole must be scoped to a specific role ARN, role ARN prefix, or limited to a set of accounts or organization ID/organizational unit

IAM Identity Center restrictions

For AWS IAM Identity Center, the following actions are blocked:

- All actions dealing with permissions management (e.g., sso:AttachCustomerManagedPolicyReferenceToPermissionSet)
- User, group, and membership modifications for AWS Identity Store
- Tag management

AWS Organizations restrictions

For AWS Organizations, only read actions will be allowed.

Additional service-specific validations

- Actions that acquire secrets or credentials, such as glue:GetConnection or redshift:GetClusterCredentials, must have conditions matching either full ARNs, ARN prefixes, or tags
- For Amazon Redshift: redshift:GetClusterCredentials is only allowed on a specific database name, and redshift:GetClusterCredentialsWithIAM is only allowed on a specific workgroup name

> **Note**
>
> When managing IAM resources in the account, we recommend using a path that indicates your name, e.g., arn:aws:iam::111122223333:role/partner.com/rolename. This will help differentiate the resources associated with your integration and make discovery, audit, and analysis easier for customers.

Cross-account access requirements

Statements that potentially allow cross-account access must include at least one of the following:

- A condition specifying the account or organization for the resource (e.g., aws:ResourceOrgId matching one or more expected values)
- A Resource field that includes a specific account (e.g., arn:aws:sqs:*:111122223333:*)
- A Resource field that includes a non-wildcard account and a full resource name (e.g., arn:aws:s3:::full-bucket-name)

> **Note**
>
> Cross-account access is a sensitive capability that requires clear business justification. AWS will carefully review the need for cross-account access during the onboarding process.

Policy templates

Policy templates are a new IAM construct designed for defining temporary permissions that partners request in customers' accounts. Like regular IAM policies, they define permissions using statements with Effect, Action, Resource, and Condition elements. The key difference is that policy templates include parameters (such as @{bucketName}) that are replaced with actual values when you create a delegation request.

How Policy Templates Work

As part of the onboarding process, you register your policy templates with AWS. AWS assigns each template a unique ARN that you reference when creating delegation requests.

When you create a delegation request, you specify:

- The policy template ARN
- Parameter values to substitute into the template

AWS combines the template with your parameter values to generate a standard IAM policy. Customers review this final rendered policy when approving your delegation request, seeing exactly what permissions will be granted.

> **Note**
>
> The final rendered policy has a maximum size limit of 2048 characters.

Here's a simple example showing how template substitution works.

Policy Template:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:PutObject"
            ],
            "Resource": "arn:aws:s3:::@{bucketName}/*"
        }
    ]
}
```

Parameters Provided in Delegation Request:

```
{
    "Name": "bucketName",
    "Values": ["customer-data-bucket"],
    "Type": "String"
}
```

Final rendered policy (what customers see):

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:PutObject"
            ],
            "Resource": "arn:aws:s3:::customer-data-bucket/*"
        }
    ]
}
```

Template Syntax

Policy templates use two key features to provide flexibility: parameter substitution and conditional statements. Parameter substitution allows you to define placeholders in your template that are replaced with actual values when creating a delegation request. Conditional statements allow you to include or exclude entire policy statements based on parameter values.

Parameter Substitution and Types

Use the @{parameterName} syntax to define parameters in your policy template. When creating a delegation request, you must specify the type for each parameter.

String

A single value that is substituted directly into the template.

Template:

```
"Resource": "arn:aws:s3:::@{bucketName}/*"
```

Parameters:

```
{
    "Name": "bucketName",
    "Values": ["my-bucket"],
    "Type": "String"
}
```

Rendered result:

```
"Resource": "arn:aws:s3:::my-bucket/*"
```

StringList

Multiple values that generate multiple resource entries. When a StringList parameter is used in a resource ARN, it expands to create separate resource entries for each value.

Template:

```
"Resource": "arn:aws:s3:::@{bucketNames}/*"
```

Parameters:

```
{
    "Name": "bucketNames",
    "Values": ["bucket-1", "bucket-2"],
    "Type": "StringList"
}
```

Rendered result:

```
"Resource": [
    "arn:aws:s3:::bucket-1/*",
    "arn:aws:s3:::bucket-2/*"
]
```

Cross-Product Behavior

When multiple parameters are used in the same resource ARN, StringList parameters create a cross-product of all combinations.

Template:

```
"Resource": "arn:aws:s3:::@{bucketNames}/@{prefix}/*"
```

Parameters:

```
[
    {
        "Name": "bucketNames",
        "Values": ["bucket-1", "bucket-2"],
        "Type": "StringList"
    },
    {
        "Name": "prefix",
        "Values": ["data"],
        "Type": "String"
    }
]
```

Rendered result:

```
"Resource": [
    "arn:aws:s3:::bucket-1/data/*",
    "arn:aws:s3:::bucket-2/data/*"
]
```

Conditional Statements

Use the @Enabled directive to conditionally include or exclude entire statements based on parameter values.

Syntax:

- @Enabled: "parameterName" - Include the statement when parameter value is "True"
- @Enabled: "!parameterName" - Include the statement when parameter value is NOT "True" (negation)

Template:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": ["s3:GetObject"],
            "Resource": "*"
        },
        {
            "@Enabled": "ENABLE_S3_WRITE",
            "Effect": "Allow",
            "Action": ["s3:PutObject"],
            "Resource": "arn:aws:s3:::@{bucketName}/*"
        }
    ]
}
```

Parameters (when ENABLE_S3_WRITE is "True"):

```
[
    {
        "Name": "bucketName",
```

```
        "Values": ["my-bucket"],
        "Type": "String"
    },
    {
        "Name": "ENABLE_S3_WRITE",
        "Values": ["True"],
        "Type": "String"
    }
]
```

Rendered result:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": ["s3:GetObject"],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": ["s3:PutObject"],
            "Resource": "arn:aws:s3:::my-bucket/*"
        }
    ]
}
```

Parameters (when ENABLE_S3_WRITE is "False"):

```
[
    {
        "Name": "bucketName",
        "Values": ["my-bucket"],
        "Type": "String"
    },
    {
        "Name": "ENABLE_S3_WRITE",
        "Values": ["False"],
        "Type": "String"
    }
]
```

Rendered result:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": ["s3:GetObject"],
            "Resource": "*"
        }
    ]
}
```

When ENABLE_S3_WRITE is set to "True", the conditional statement is included. When set to "False", the statement is excluded from the rendered policy.

Additional Examples

The following examples demonstrate common patterns for using policy templates in temporary delegation. They focus on creating IAM roles with permission boundaries for long-term access and show different strategies for scoping permissions to specific resources. These examples illustrate how to balance flexibility with security by using techniques such as ARN prefixes, resource tagging, and permission boundary updates.

Example 1: Granting Long-Term Access to Specific Resources

The following permission boundary is submitted as "SQSAccessorBoundary" for "partner.com":

```
{
    "Effect": "Allow",
    "Action": [
        "sqs:DeleteMessage",
        "sqs:ReceiveMessage",
        "sqs:SendMessage"
    ],
    "Resource": "arn:aws:sqs:*:*:*",
    "Condition": {
        "StringEquals": {
            "aws:ResourceAccount": "${aws:PrincipalAccount}"
        }
    }
```

```
}
```

> **Note**
>
> This includes a same-account condition to avoid granting access to queues in other accounts with open resource policies. A direct reference to the customer's account ID cannot be included because the boundary is shared across all customers and cannot be templated.

Since this is the first version of this policy, its ARN is arn:aws:iam::partner:policy/permissions-boundary/partner.com/SQSAccessorBoundary_2025_01_15

The following policy template is submitted for temporary access permissions:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "sqs:ListQueues"
            ],
            "Resource": "arn:aws:sqs:*:*:*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "iam:CreateRole",
                "iam:PutRolePermissionsBoundary",
                "iam:PutRolePolicy"
            ],
            "Resource": "arn:aws:iam::@{AccountId}:role/partner.com/SQSAccessor",
            "Condition": {
                "StringEquals": {
                    "iam:PermissionsBoundary": "arn:aws:iam::partner:policy/
permissions-boundary/partner.com/SQSAccessorBoundary_2025_01_15"
                }
            }
        }
    ]
```

```
}
```

Example 2: Using ARN Prefixes

The permission boundary can specify a resource ARN prefix to limit access:

```
"Resource": "arn:aws:sqs:*:@{AccountId}:PartnerPrefix*"
```

This limits access to only the resources with that prefix, reducing the scope of accessible resources.

Example 3: Using Tags for Resource Access Control

You can tag resources during temporary delegated access and rely on those tags for long-term access control.

Permission boundary allowing access to tagged resources:

```
{
    "Effect": "Allow",
    "Action": [
        "sqs:DeleteMessage",
        "sqs:ReceiveMessage",
        "sqs:SendMessage"
    ],
    "Resource": "arn:aws:sqs:*:*:*",
    "Condition": {
        "Null": {
            "aws:ResourceTag/ManagedByPartnerDotCom": "false"
        },
        "StringEquals": {
            "aws:ResourceAccount": "${aws:PrincipalAccount}"
        }
    }
}
```

Policy template to tag new queues on creation:

```
{
    "Effect": "Allow",
    "Action": [
        "sqs:CreateQueue",
        "sqs:TagQueue"
```

```
    ],
    "Resource": "arn:aws:sqs:*:*:*",
    "Condition": {
        "Null": {
            "aws:RequestTag/ManagedByPartnerDotCom": "false"
        }
    }
}
```

Policy template to tag pre-existing queues and create the role:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "sqs:TagQueue"
            ],
            "Resource": "arn:aws:sqs:*:@{AccountId}:@{QueueName}",
            "Condition": {
                "ForAllValues:StringEquals": {
                    "aws:TagKeys": "ManagedByPartnerDotCom"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": [
                "iam:CreateRole",
                "iam:PutRolePermissionsBoundary",
                "iam:PutRolePolicy"
            ],
            "Resource": "arn:aws:iam::@{AccountId}:role/partner.com/SQSAccessor",
            "Condition": {
                "StringEquals": {
                    "iam:PermissionsBoundary": "arn:aws:iam::partner:policy/
permissions-boundary/partner.com/SQSAccessorBoundary_2025_01_15"
                }
            }
        }
    ]
}
```

This approach allows customers to explicitly confirm which specific resources can be accessed long-term.

Example 4: Updating the Permission Boundary

To update a permission boundary, register a new version with a new date suffix and request permission to replace it.

Updated permission boundary with additional permission:

```
{
    "Effect": "Allow",
    "Action": [
        "sqs:DeleteMessage",
        "sqs:PurgeQueue",
        "sqs:ReceiveMessage",
        "sqs:SendMessage"
    ],
    "Resource": "arn:aws:sqs:*:*:*",
    "Condition": {
        "StringEquals": {
            "aws:ResourceAccount": "${aws:PrincipalAccount}"
        }
    }
}
```

As the second version, this policy has the ARN: arn:aws:iam::partner:policy/permissions-boundary/partner.com/SQSAccessorBoundary_2025_01_20

Policy template to update the permission boundary on the existing role:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "iam:PutRolePermissionsBoundary"
            ],
            "Resource": "arn:aws:iam::@{AccountId}:role/partner.com/SQSAccessor",
            "Condition": {
                "StringEquals": {
```

```
                    "iam:PermissionsBoundary": "arn:aws:iam::partner:policy/
permissions-boundary/partner.com/SQSAccessorBoundary_2025_01_20"
                }
            }
        }
    ]
}
```

Customers must approve this delegation request to update the permission boundary on the existing role.

Building your integration

Understanding the Request Lifecycle

Before building your integration, it's important to understand how delegation requests progress from creation to completion.

Request States

A delegation request progresses through the following states:

State	Description
Unassigned	Request created but not yet associated with a customer account and an IAM principal. The request might have been created without specifying a target account, or with a target account ID but not yet claimed by the account owner.
Assigned	Request associated with a customer account and awaiting review
Pending Approval	Customer has forwarded the request to an administrator for approval
Accepted	Request approved by customer but exchange token not yet released
Finalized	Exchange token released to product provider. The delegation period (exchange token validity) begins when the request reaches Finalized state
Rejected	Request rejected by customer

State	Description
Expired	Request expired due to inactivity or timeout

State Transitions

Normal Flow (Approval Path)

- Unassigned → Assigned: Customer associates the request with their account
- Assigned → Accepted OR Assigned → Pending Approval: Customer approves the request directly OR forwards to administrator for review
- Pending Approval → Accepted: Administrator approves the request
- Accepted → Finalized: Customer releases the exchange token

Rejection Path

- Assigned → Rejected: Customer rejects the request
- Pending Approval → Rejected: Administrator rejects the request
- Accepted → Rejected: Customer revokes approval before releasing token

Expiration Path

Requests automatically expire if no action is taken within the specified timeframe:

- Unassigned → Expired (1 day)
- Assigned → Expired (7 days)
- Pending Approval → Expired (7 days)
- Accepted → Expired (7 days)
- Rejected → Expired (7 days)
- Finalized → Expired (7 days)

Terminal States

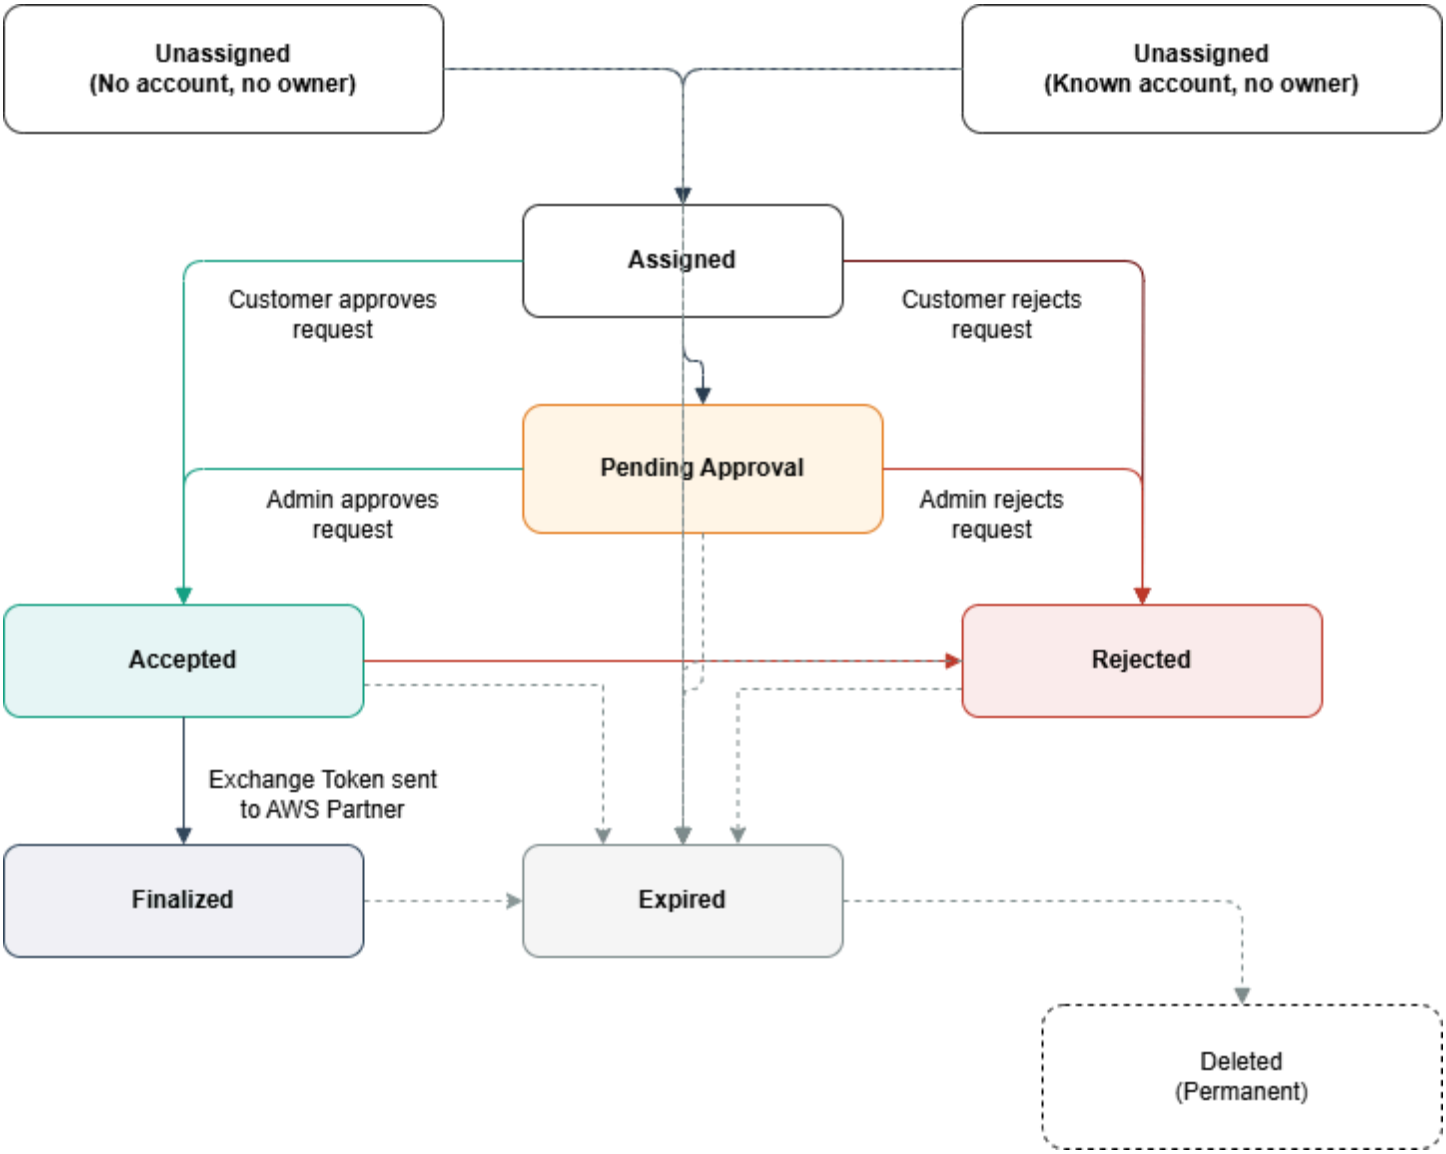
The following states are terminal (no further transitions):

- Finalized: Exchange Token sent
- Rejected: Request was denied
- Expired: Request timed out or delegation period ended

Expired requests are eventually deleted from the system after the retention period.

Managing delegation request states in your application

As a partner, you must track delegation request states in your system and surface them to your customers. When you receive SNS notifications about state changes, store these updates in your backend and reflect them in your customer-facing UI. Pay special attention to the Pending Approval state—when a customer forwards a request to an administrator for review, AWS sends a Pending Approval notification to you. Requests can remain in this state for up to 7 days while waiting for administrator action. During this time, show customers that their request is pending administrator approval in your application. Consider providing a deep link to the AWS Console where customers can check the request status or follow up with their administrator. Properly handling the state machine in your backend and surfacing the correct state information to customers at each stage is important for a good integration experience.



Configuring Notifications

IAM uses Amazon Simple Notification Service (SNS) to communicate delegation request state changes to you. When you create a delegation request, you must provide an SNS topic ARN from your registered AWS account. IAM will publish messages to this topic for important events, including when customers approve or reject requests and when the exchange token is ready.

> **Note**
>
> SNS topics cannot be in opt-in AWS Regions. Your SNS topic must be in an AWS Region that is enabled by default. For a list of opt-in Regions, see Managing AWS Regions in the AWS Account Management guide.

SNS Topic Configuration

To receive delegation request notifications, you must configure your SNS topic to grant IAM permissions to publish messages to it. Add the following policy statement to your SNS topic policy:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowIAMServiceToPublish",
            "Effect": "Allow",
            "Principal": {
                "Service": "iam.amazonaws.com"
            },
            "Action": "SNS:Publish",
            "Resource": "arn:aws:sns:us-east-1:111122223333:TOPIC-NAME"
        }
    ]
}
```

> **Important**
>
> The SNS topic must be in one of your registered AWS accounts. IAM will not accept SNS topics from other accounts. If the topic policy is not correctly configured, you will not receive state change notifications or the exchange token.

Notification Types

IAM sends two types of notifications:

StateChange Notifications

Sent when a delegation request transitions to a new state (Assigned, Pending Approval, Accepted, Finalized, Rejected, Expired).

ExchangeToken Notifications

Sent when a customer releases the delegation token (state Finalized). This notification includes the exchange token you need to obtain credentials.

Notification States

You will receive notifications for the following delegation request states:

State	Notification Type	Description
ASSIGNED	StateChange	Request has been associated with a customer account
PENDING APPROVAL	StateChange	Customer has forwarded the request to an administrator for approval
ACCEPTED	StateChange	Customer has approved the request but not yet released the token
FINALIZED	StateChange	Customer has released the exchange token
FINALIZED	ExchangeToken	This notification contains the Exchange Token
REJECTED	StateChange	Customer has rejected the request
EXPIRED	StateChange	Request expired before completion

Notification Message Format

IAM publishes standard SNS notifications. The delegation request information is contained in the Message field as a JSON string.

Common Fields (All Notifications)

Field	Type	Description
Type	String	Either "StateChange" or "ExchangeToken"
RequestId	String	The IAM delegation request ID
Requestor WorkflowId	String	The workflow ID you provided when creating the request
State	String	Current state of the request

Field	Type	Description
OwnerAccountId	String	Customer's AWS account ID
UpdatedAt	String	Timestamp when the state changed (ISO 8601 format)

Additional Fields (ExchangeToken Notifications Only)

Field	Type	Description
ExchangeToken	String	The token to exchange for credentials using AWS STS GetDelegatedAccessToken API
ExpiresAt	String	When the delegated access expires (ISO 8601 format)

Example Notifications

StateChange Notification

```
{
  "Type": "Notification",
  "MessageId": "61ee8ad4-6eec-56b5-8f3d-eba57556aa13",
  "TopicArn": "arn:aws:sns:us-east-1:123456789012:partner-notifications",
  "Message": "{\"RequestorWorkflowId\":\"workflow-12345\",\"Type\":\"StateChange\",
\"RequestId\":\"dr-abc123\",\"State\":\"ACCEPTED\",\"OwnerAccountId\":\"111122223333\",
\"UpdatedAt\":\"2025-01-15T10:30:00.123Z\"}",
  "Timestamp": "2025-01-15T10:30:00.456Z",
  "SignatureVersion": "1",
  "Signature": "...",
  "SigningCertURL": "...",
  "UnsubscribeURL": "..."
}
```

ExchangeToken Notification

```
{
  "Type": "Notification",
  "MessageId": "e44e5435-c72c-5333-aba3-354406782f5b",
  "TopicArn": "arn:aws:sns:us-east-1:123456789012:partner-notifications",
```

```
  "Message": "{\"RequestId\":\"dr-abc123\",\"RequestorWorkflowId\":\"workflow-12345\",
\"State\":\"FINALIZED\",\"OwnerAccountId\":\"111122223333\",\"ExchangeToken\":
\"eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9...\",\"ExpiresAt\":\"2025-01-15T18:30:00.123Z\",
\"UpdatedAt\":\"2025-01-15T10:30:00.456Z\",\"Type\":\"ExchangeToken\"}",
  "Timestamp": "2025-01-15T10:30:00.789Z",
  "SignatureVersion": "1",
  "Signature": "...",
  "SigningCertURL": "...",
  "UnsubscribeURL": "..."
}
```

Exchange Tokens

An exchange token or a trade in token is issued by IAM when a customer accepts and finalizes a delegation request. The product provider uses this exchange or trade in token to call the AWS STS GetDelegatedAccessToken API to obtain temporary AWS credentials with the permissions customers approved. The exchange token itself does not grant access to your AWS resources; it must be exchanged for actual credentials through AWS STS.

The exchange token can only be redeemed by the product provider account that created the delegation request. The requesting account is embedded in the token, ensuring that only the authorized product provider can obtain credentials to access customer account.

Access Duration

The delegation period starts when customer releases the exchange token, not when the product provider redeems it. After the customer releases the token:

- The product provider receives the token through an SNS notification
- They can immediately exchange it for credentials
- Credentials expire at: release time + approved duration
- The product provider can exchange the token multiple times before expiration to obtain fresh credentials if needed

Multiple Redemptions

Product providers can exchange the token multiple times during the validity period to obtain fresh credentials. However, all credentials obtained from the same exchange token expire at the same time, based on when you released the token.

Example: If you approve a 2-hour delegation request and release the token at 10:00 AM:

Token Release Time	Token Exchange Time	Credential Expiry	Usable Time
10:00 am	10:00 am	12:00 pm	2 hours
10:00 am	10:20 am	12:00 pm	1 hour 40 minutes
10:00 am	11:40 am	12:00 pm	20 minutes
10:00 am	12:10 pm	Failed (token expired)	0 minutes

As shown in the table, exchanging the token later in the validity period results in less usable time for the product provider.

Account access manager

What is account access manager?

Account access manager lets you assign AWS account access to users and groups in your IAM Identity Center organization instance. You assign access using the IAM roles in your AWS accounts. You can use account access manager alongside IAM Identity Center permission sets or on its own. Both account access manager and IAM Identity Center permission sets use the users and groups that you synchronized from your identity source or created directly in IAM Identity Center.

Why use account access manager?

Account access manager enables you to assign your existing IAM roles to the users and groups you have synchronized into IAM Identity Center from your corporate source of identities. Using your existing IAM roles gives you extra flexibility to tailor user access, including:

- Configure IAM role tags and use session tags for attribute-based access control (ABAC).
- Configure IAM role trust policy to restrict role assumption or use IdP-asserted claims as trust policy conditions.
- Configure IAM role paths to group roles logically and simplify administration. For more information, see Configure IAM role paths to group roles logically and simplify administration.

The following table compares the three account access options:

	IAM roles + account access manager	IAM Identity Center permission sets	IAM roles + IAM federation (direct role assumption)
Best for	Custom IAM roles that vary across accounts	Uniform baseline human access such as read-only and admin provisioned as immutable IAM roles	Suitable for workloads

	IAM roles + account access manager	IAM Identity Center permission sets	IAM roles + IAM federation (direct role assumption)
Scope	Multiple accounts (AWS organization)	Multiple accounts (AWS organization)	Per account
IAM role provisioning	Requires infrastructure as code (IaC) or manual provisioning through the AWS IAM console	Automatically provisioned	Requires infrastructure as code (IaC) or manual provisioning through AWS IAM and external IdP consoles
Role-to-identity mapping resides in	Account access manager	IAM Identity Center	External IdP
End user experience	Users access AWS accounts through the AWS account access portal URL after signing into AWS as IAM Identity Center users.	Users access AWS accounts through the AWS access portal after signing into AWS as IAM Identity Center users.	Users access AWS accounts through account-specific SAML applications (icons) in their IdP portal.

	IAM roles + account access manager	IAM Identity Center permission sets	IAM roles + IAM federation (direct role assumption)
AWS CLI user experience	1. User signs into AWS and then accesses an account with a specific role in a web browser. 2. User types **aws login** on the command line to retrieve the IAM role session credentials from the browser. For the duration of the IAM role session, the user can keep working with the AWS CLI without having to re-authenticate in step 1.	User configures a profile including the desired account and role pair by typing **aws configure sso**. User types **aws sso login** to initiate a new session using a profile. If there is no active IAM Identity Center session, the user authenticates in a browser and authorizes access there. See the AWS IAM Identity Center User Guide for more details.	Custom integrations using AWS SDK credential providers

Key capabilities

Account access portal

Account access manager provides users with an account access portal where they can view and access the AWS accounts assigned to them through account access manager.

CLI access

Your workforce can access AWS accounts through the AWS CLI using the **aws login** command after signing into AWS in a browser.

Account access APIs

Account access manager has its own API namespace, `account-access`, which is separate from the IAM API. You use this namespace in the AWS CLI and SDKs.

Getting started with account access manager

The following outlines how you can get started with account access manager. This assumes the IAM roles you want to assign already exist in their respective AWS accounts. If these roles do not exist, see Create a role using custom trust policies for information about how to create new roles.

To get started with account access manager

1. Make sure you have an organization instance of IAM Identity Center enabled and your workforce users and groups provisioned there. See the Getting started with IAM Identity Center section in the AWS IAM Identity Center User Guide for more information. See the section called "Prerequisites and considerations" later in this topic for more details.

   > **Note**
   >
   > If you are using IAM Identity Center replicated to multiple AWS Regions or with a customer managed key (CMK), you must add `kms:Decrypt` permission for account access manager to use this CMK when connecting to IAM Identity Center. For more information, see Baseline KMS key policy in the *AWS IAM Identity Center User Guide*.

2. Make sure you have permissions to enable account access manager and manage account assignments in it. For more information, see the section called "Identity and access management for account access manager".
3. Enable account access manager through the console or API.
4. Update your firewalls and gateways for access to the account access portal.
5. Grant account access manager access to IAM roles by updating their trust policy.
6. Start assigning account access to your workforce users and groups from IAM Identity Center.
7. Let your users know how to access AWS accounts using account access manager role assignments.

Prerequisites and considerations

The following prerequisites and considerations apply:

- Account access manager is available in AWS Commercial Regions enabled by default. Opt-in Commercial Regions, GovCloud (US), China, and other non-commercial Regions are not supported.
- At enablement, account access manager connects to a single organization instance of IAM Identity Center. You must enable an AWS organization and an organization instance of IAM Identity Center beforehand. Account instances of IAM Identity Center are not supported.
- We recommend enabling account access manager in the same AWS Region where you enabled your IAM Identity Center instance. If you haven't done it already, see Considerations for choosing an AWS Region in the AWS IAM Identity Center User Guide.
- Both the organization instance of IAM Identity Center and account access manager must be enabled in your organization's management account.

Enable account access manager

After creating an organization instance of IAM Identity Center, you can enable account access manager through its console or API. You must do this in the same AWS account and Region as your IAM Identity Center instance.

Before enabling account access manager, run the following command from the AWS organization management account to grant account access manager access to your organization:

```
aws organizations enable-aws-service-access --service-principal account-
access.amazonaws.com
```

> **Note**
>
> While the account access manager console is part of the IAM console, its API lives in a separate namespace.

Use one of the following methods to enable account access manager:

Console

To enable account access manager

1. Sign in to your organization's management account.
2. In the AWS Identity and Access Management console navigation pane, choose **Account access manager**.
3. Confirm the console Region is set to the primary Region of your IAM Identity Center instance.
4. If there is no organization instance of IAM Identity Center, you will be prompted to enable one now before continuing. Otherwise, choose **Enable account access manager**.

AWS CLI

First find the ARN of the IAM Identity Center instance and confirm the Region code matches the primary Region of IAM Identity Center. Then, run the following command:

```
aws account-access create-application \
  --region <Region> \
  --identity-source '{
    "identityCenter": {
      "instanceArn": "<IAM_IDENTITY_CENTER_INSTANCE_ARN>"
    }
  }'
```

Update firewalls and gateways

The account access portal provides your users with single sign-on access to the AWS accounts assigned to them through account access manager.

If you filter access to specific AWS domains or URL endpoints by using a web content filtering solution such as next-generation firewalls (NGFW) or Secure Web Gateways (SWG), you must allowlist the domains and URL endpoints associated with the account access portal.

The following list provides the dual-stack domains and URL endpoints to add to your web-content filtering solution allowlists. Account access manager has no IPv4-only endpoints.

Dual-stack allow list

The account access portal URL:

- `https://[Tenant-ID].account-access.[Region].app.aws`

The APIs that the account access portal calls:

- `[Tenant-ID].account-access.[Region].app.aws/api/*`
- `[Tenant-ID].account-access.[Region].app.aws/auth/*`

Tenant-ID is a unique random identifier associated with account access manager. To find its value, navigate to the **Settings** tab in the account access manager console, and look up the **Application URL** in the **Instance details** section. Tenant-ID is the first subdomain in the URL.

The account access manager service endpoints:

- Control-plane: `account-access.[Region].api.aws`
- Runtime: `account-access-runtime.[Region].api.aws`
- Console: `console.aws.amazon.com/account-access`

If you use the AWS CLI, you can find the tenant ID by running the following CLI command in your organization's management or delegated administrator account.

```
aws account-access list-applications
```

The response contains information about account access manager including the application ARN and the tenant ID.

```
{
    "applications": [
        {
            "applicationArn": "arn:aws:account-access:us-
west-2:123456789012:application/1234567890abcdef",
            "tenantId": "aa-gyxmap389",
            "createdAt": "2026-03-27T18:31:19+00:00",
            "updatedAt": "2026-03-27T18:31:19+00:00"
        }
    ]
}
```

Considerations for allowlisting domains and URL endpoints

In addition to the allowlist requirements for the account access portal, the other services and applications you use might require allowlisting of domains.

- You need to allowlist the AWS access portal and its dependencies. For more information, see Updating firewalls and gateways to allow access to the AWS access portal in the AWS IAM Identity Center User Guide.
- To access AWS accounts, the AWS Management Console, and the account access manager console, you must allowlist additional domains. Refer to Troubleshooting in the *AWS Management Console Getting Started Guide* for a list of AWS Management Console domains.

Delete account access manager

When account access manager is deleted, all the data in it is deleted and cannot be recovered.

Use the following procedure to delete account access manager.

Console

To delete your account access manager instance

1. Sign in to your organization's management account.
2. In the AWS Identity and Access Management console navigation pane, choose **Account access manager**.
3. Confirm the console Region is set to the primary Region of your account access manager instance.
4. Choose the **Settings** tab.
5. In the **Delete account access manager** section, choose **Delete**.
6. The dialog box prompts you to confirm. When ready, choose **Delete**.

AWS CLI

Run the following command to delete account access manager:

```
aws account-access delete-application \
  --region "<Region>" \
```

```
  --application-arn "<account_access_manager_ARN>"
```

Warning

Deleting account access manager is irreversible and has the following consequences:

- All role assignments are permanently removed. Your users immediately lose the ability to access AWS accounts with IAM roles assigned through account access manager.
- Account access manager is removed from the AWS access portal for all users.
- Active sessions of IAM roles assigned through account access manager continue until they expire, but users cannot start new sessions.
- If you re-enable account access manager later, you must recreate all assignments from scratch. Previous assignments are not recoverable.

Before deleting, consider disabling user access in individual accounts to temporarily restrict access.

Manage access to AWS accounts

Account access manager is integrated with IAM Identity Center and AWS Organizations to centrally manage the assignment of existing IAM roles across multiple AWS accounts without configuring each of your accounts individually. With account access manager, you assign existing IAM roles in your AWS accounts to IAM Identity Center users and groups to control their access to specific AWS accounts.

With account access manager, your teams can create their own custom IAM roles in their AWS accounts, and you as administrator use account access manager to centrally manage assignments of IAM Identity Center users and groups to these IAM roles.

Note

Within the context of account access manager, the terms *users* and *groups* exclusively refer to workforce *users* and *groups* in IAM Identity Center.

Delegated administration

When you enable account access manager, AWS creates it in the management account in AWS Organizations because account access manager manages IAM role assignments for an entire AWS Organization. You can choose to delegate administration of account access manager to a member account in AWS Organizations.

If you choose to register a member account as a delegated administrator for account access manager, users in this account can perform most account access manager administrative tasks. The following table indicates whether an account access manager administrative task can be performed by users in an organization management account, a delegated administration member account, or another member account. IAM role management is excluded from the list of administrative tasks because it takes place outside of account access manager.

Account access manager administrative tasks	Management account	Delegated administrator account	Member account
Manage IAM role assignments*	Yes	Yes	No
Enable account access manager	Yes	No	No
Delete account access manager	Yes	No	No
Enable or disable user access in the management account	Yes	No	No
Enable or disable user access in a member account	Yes	Yes	No
Register or deregister a member account as	Yes	No	No

Account access manager administrative tasks	Management account	Delegated administrator account	Member account
a delegated administrator			

*Refer to the best practices for delegated administration regarding user and group assignments to the management account.

Register a member account

To configure delegated administration, you must first register a member account in your organization as a delegated administrator. Users in that member account who have sufficient permissions will have administrative access to account access manager.

Account access manager supports registering only one member account as a delegated administrator at a time. You can only register a member account while signed in with credentials from the management account.

Use the following procedure to register a member account in your AWS organization as a delegated administrator.

To register a member account

1. Sign in to the AWS Management Console using the credentials of your management account in AWS Organizations. Management account credentials are required to run the RegisterDelegatedAdministrator API.
2. Select the Region where account access manager was enabled and then open the AWS Identity and Access Management console.
3. Choose **Account access manager**, and then choose the **Settings** tab.
4. In the **Delegated administrator** section, choose **Register**.
5. On the **Register delegated administrator** page, select the AWS account you want to register, and then choose **Register**.

Deregister a member account

You can only deregister a member account while signed in with credentials from the management account.

Use the following procedure to deregister a member account in your AWS organization that had previously been designated as a delegated administrator.

> **Important**
>
> When you deregister an account, you remove the ability for all admin users to manage account access manager from that account. They can no longer administer AWS account access from this account.
> This operation does not affect permissions or assignments configured in account access manager. Your end users continue to access their AWS accounts from the account access portal.

To deregister a member account

1. Sign in to the AWS Management Console using the credentials of your management account in AWS Organizations. Management account credentials are required to run the DeregisterDelegatedAdministrator API.
2. Select the Region where account access manager was enabled, and then open the AWS Identity and Access Management console.
3. Choose **Account access manager**, and then choose the **Settings** tab.
4. In the **Delegated administrator** section, choose **Deregister account**.
5. In the **Deregister delegated administrator** dialog box, review the security implications, and then confirm that you understand.
6. Choose **Deregister**.

View the registered delegated administrator account

Use the following procedure to find which member account in your AWS Organizations has been configured as the delegated administrator for account access manager.

To view your registered member account

1. Sign in to the AWS Management Console using the credentials of your management account in AWS Organizations.
2. Select the Region where account access manager was enabled and then open the AWS Identity and Access Management console.
3. Choose **Account access manager**, and then choose the **Settings** tab.
4. In the **Delegated administrator** section, you can view the current delegated administrator account details.

Prepare your IAM roles

Before you start assigning IAM roles to IAM Identity Center users and groups, you need to:

1. Identify the relevant IAM roles in the accounts of interest, and
2. Make sure the trust policy of the IAM roles contains the Statement provided below.

If the role has an existing trust policy, add this statement to its Statement array. If you're creating a new role, you can use the entire policy document. This policy statement allows account access manager to assume the role and set context on behalf of users. The `Condition` block provides confused-deputy protection by ensuring that account access manager can assume the role only on behalf of your own account and your account access manager application. For more information, see Update a role trust policy.

Replace `<your-account-id>` with your AWS account ID, `<region>` with your IAM Identity Center primary Region, and `<application-id>` with your account access manager application ID. You can find the application ARN on the **Settings** page in the account access manager console.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "AccountAccessManagerIAMRoleTrustPolicyStatement",
      "Effect": "Allow",
      "Principal": {
        "Service": "account-access.amazonaws.com"
      },
      "Action": [
```

```
        "sts:AssumeRole",
        "sts:SetContext"
      ],
      "Condition": {
        "StringEquals": {
          "aws:SourceAccount": "<your-account-id>",
          "aws:SourceArn": "arn:aws:account-access:<region>:<your-account-
id>:application/<application-id>"
        }
      }
    }
  ]
}
```

Optional — `sts:TagSession`. Add `sts:TagSession` to the `Action` list if you want upstream assertion attributes from your identity provider (for example, group memberships, department, cost-center) to propagate as principal tags on the session that account access manager issues. Without this action, role assumption still succeeds; only session-tag propagation is suppressed. Add it when downstream IAM policies in the target account use principal tags (`aws:PrincipalTag/<key>`); leave it out otherwise. Keep the same `Condition` block.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "AccountAccessManagerIAMRoleTrustPolicyStatement",
      "Effect": "Allow",
      "Principal": {
        "Service": "account-access.amazonaws.com"
      },
      "Action": [
        "sts:AssumeRole",
        "sts:SetContext",
        "sts:TagSession"
      ],
      "Condition": {
        "StringEquals": {
          "aws:SourceAccount": "<your-account-id>",
          "aws:SourceArn": "arn:aws:account-access:<region>:<your-account-
id>:application/<application-id>"
        }
      }
```

```
    }
  ]
}
```

> **Note**
>
> We recommend you update your IAM role creation workflows to add this trust policy statement automatically where needed.

Assign and remove access

Assign user or group access to an AWS account

You can assign a user or group access to an AWS account by creating an assignment between the user or group, the account, and the IAM role that the user or group can assume in the account. Thus, a single assignment is a triplet consisting of the user or group ID, the account ID, and the IAM role ARN.

If you want to perform bulk assignments such as assigning the same role to a number of users and groups, you must create each assignment individually. You can script this procedure using the account access API, and the AWS SDK/CLI.

Console

The console provides a few different ways to assign new access depending on whether you want to first identify the account, the user, or the group.

> **Note**
>
> The account access manager console provides a search capability for users, groups, and accounts. To identify the role you want to assign, you must find its name (or ARN) beforehand. The account access manager console cannot detect IAM roles in AWS accounts.

For all procedures in this section, sign in to the management account (or delegated admin account), select the Region where account access manager is enabled, and navigate to **Account access manager** in the IAM console.

Accounts tab

To assign user or group access from the Accounts tab

1. Choose the **Accounts** tab.
2. If you already know the account ID, choose **Assign new access**. On the **Assign account access** page, look up the desired user or group, enter the account ID, and IAM role name, and then choose **Assign access**.
3. If you need to first find the account, you can search for the desired AWS account by its name, ID, or email address. Alternatively, you can review the organizational structure or account list to find the relevant AWS account. Choose the radio button in front of the account and then **Assign new access**. On the **Assign account access** page, look up the desired user or group, enter the IAM role name, and then choose **Assign access**.
4. The organizational structure or account list lets you choose an account to view account details and account access assignments. You can choose **Assign new access** from there too.

Users tab

To assign user access from the Users tab

1. Choose the **Users** tab.
2. You can search users by username and display name or find them in the displayed user list.
3. Choose the user you want to assign new access to.
4. The next page shows the user attributes, account assignments, and group memberships.
5. Choose **Assign new access**.
6. On the **Assign account access** page, enter the account ID and IAM role name, and then choose **Assign access**.

Groups tab

To assign group access from the Groups tab

1. In the navigation pane, choose **Account access manager**.
2. Choose the **Groups** tab.
3. You can search groups by group name or find them in the displayed group list.
4. Choose the group you want to assign new access to.

5. The next page shows the group attributes, account assignments, and user members.
6. Choose **Assign new access**.
7. On the **Assign account access** page, enter the account ID and IAM role name, and then choose **Assign access**.

AWS CLI

The following AWS CLI command can be used to create an account assignment for a user:

```
aws account-access create-entitlement \
  --region <Region> \
  --application-arn "<Account_access_manager_ARN>" \
  --entitlement '{
    "principalRole": {
      "principal": {
        "identityCenter": {
          "userId": "<Identity_Center_User_ID>"
        }
      },
      "roleArn": "arn:aws:iam::<ACCOUNT_ID>:role/<ROLE_NAME>"
    }
  }'
```

The following AWS CLI command can be used to create an account assignment for a group:

```
aws account-access create-entitlement \
  --region <Region> \
  --application-arn "<Account_access_manager_ARN>" \
  --entitlement '{
    "principalRole": {
      "principal": {
        "identityCenter": {
          "groupId": "<IDC_GROUP_ID>"
        }
      },
      "roleArn": "arn:aws:iam::<ACCOUNT_ID>:role/<ROLE_NAME>"
    }
  }'
```

Remove user or group access to an AWS account

You can find the assignment to remove in several ways.

Console

For all procedures in this section, sign in to the management account (or delegated admin account), select the Region where account access manager is enabled, and navigate to **Account access manager** in the IAM console.

Accounts tab

To remove user or group access from the Accounts tab

1. Choose the **Accounts** tab.
2. Find the relevant account and choose its name.
3. In the **Account access assignments** section, choose the user or group you want to remove access for, and choose **Unassign**.
4. In the modal, choose **Unassign** to confirm.

Users tab

To remove user access from the Users tab

1. Choose the **Users** tab.
2. Choose the user you want to remove access for.
3. In the **Account access assignments** section, choose the account you want to remove access for, and choose **Unassign**.
4. In the modal, choose **Unassign** to confirm.

AWS CLI

To remove access with the CLI, you first need to find the account assignment (entitlement) and then use its ID in the following command. You can see later in this topic how to search for account assignments for a specific account, user, group, or role. The CLI refers to assignments as entitlements.

```
aws account-access delete-entitlement \
```

```
    --region <Region> \
    --application-arn "<Account_access_manager_ARN>" \
    --entitlement-id "<ENTITLEMENT_ID>"
```

View or search account assignments

You can view account assignments in several ways.

Console

For all procedures in this section, sign in to the management account (or delegated admin account), select the Region where account access manager is enabled, and navigate to Account access manager in the IAM console.

Accounts tab

View user or group access from the Accounts tab

1. Choose the **Accounts** tab.
2. By default, you see the Hierarchy view. You can switch to the List view if desired. You can search accounts by their name, ID, email, and OU ID. When you find the desired account, choose its name.
3. On the account page, you can see the account assignments in the **Account access assignments** section. You can filter them further by username, user ID, group name, group ID, and IAM role ARN.

Users tab

View user access from the Users tab

1. Choose the **Users** tab.
2. Search for the user by name or user ID. When you find the desired user, choose the username.
3. On the user page, you can see the user's account assignments. You can filter them further by account ID, account name, and IAM role ARN.

Groups tab

View group access from the Groups tab

1. Choose the **Groups** tab.
2. Search for the group by name or group ID. When you find the desired group, choose the group name.
3. On the group page, you can see the group's account assignments. You can filter them further by account ID, account name, and IAM role ARN.

AWS CLI

The following commands illustrate how to retrieve account assignments using different filters. The CLI refers to assignments as entitlements.

Retrieve first 100 assignments (entitlements) for a specific account

```
aws account-access list-entitlements \
    --region <Region> \
    --application-arn "<Account_access_manager_ARN>" \
    --filter '{
      "principalRole": {
        "account": "<ACCOUNT_ID>"
      }
    }' \
    --max-results 100
```

Retrieve all assignments (entitlements) for a specific user

```
aws account-access list-entitlements \
    --region <Region> \
    --application-arn "<Account_access_manager_ARN>" \
    --filter '{
      "principal": {
        "type": "USER",
        "id": "<USER_ID>"
      }
    }'
```

Retrieve all assignments (entitlements) for a specific group

```
aws account-access list-entitlements \
    --region <Region> \
    --application-arn "<Account_access_manager_ARN>" \
    --filter '{
      "principal": {
        "type": "GROUP",
        "id": "<GROUP_ID>"
      }
    }'
```

Sessions and access control

Understanding sessions

Users who access AWS accounts using assignments in account access manager initiate the following session types:

1. **IAM role session** - The IAM role a user assumes is a temporary credential for access to AWS resources with a default duration of 1 hour.
2. **Account access portal session** – Users initiate this session when using the account access portal. It is managed as an application session by IAM Identity Center.
3. **AWS access portal session (also called user interactive session)** – This session is managed by IAM Identity Center.
4. **External identity source (IdP or Microsoft AD) session** – This session is applicable when the IAM Identity Center instance is connected to an external identity source for authentication.

For more information about user interactive and application sessions in IAM Identity Center including session duration, see Understanding authentication sessions in IAM Identity Center in the *AWS IAM Identity Center User Guide*.

> **Important**
>
> Sessions of IAM roles assigned by account access manager operate based on the default session duration of 1 hour, regardless of the maximum session duration set in the IAM role, the status of the sessions in the account access portal and AWS access portal.

Revoke user access

To revoke user access assumed through account access manager role assignments, see Revoke user access in the *AWS IAM Identity Center User Guide*.

Attribute-based access control

You can configure your identity provider (IdP) to send attributes as session tags through SAML assertions by setting the attribute name to `https://aws.amazon.com/SAML/Attributes/AccessControl:TagKey`, where *`TagKey`* is the session tag key you want to populate. IAM Identity Center passes the attribute name and value from the IdP through for policy evaluation.

Workforce access

Account access manager enables you to assign AWS account access to your workforce users and groups in IAM Identity Center by mapping them to IAM roles in your AWS accounts. If you are new to IAM Identity Center, see Set up workforce access to AWS resources in the *AWS IAM Identity Center User Guide* for information about authentication sessions, user access management, password management, and multi-factor authentication.

User portals

To access the AWS accounts assigned to them, your workforce users can navigate directly to the account access portal using a bookmark, or launch it from within the AWS access portal.

Your users might interact with two user portals:

Account access portal

This is a portal (URL) that allows workforce users to access the AWS accounts assigned to them using account access manager. This portal (URL) can be bookmarked for direct access and is also available in the AWS access portal as an AWS managed application.

AWS access portal

This is the main entry point into AWS for IAM Identity Center users. This portal displays all AWS applications that users have access to, including the account access portal.

Tip

We recommend bookmarking both portals for faster navigation. If you use an external identity provider, you can also create bookmark apps for both portals there.

Getting started with the account access portal

Finding the account access portal URL

To find the account access portal URL, choose the **Settings** tab in the account access manager console. Look up the **Application URL** in the **Instance details** section. The URL follows the pattern `https://[Tenant-ID].account-access.[Region].app.aws`. Tenant-ID is a unique random identifier associated with account access manager.

If you use the AWS CLI, you can find the tenant ID by running the following CLI command in your organization's management or delegated administrator account.

```
aws account-access list-applications
```

The response contains information about account access manager including the application ARN and the tenant ID. Use the tenant ID and the Region code of account access manager to construct the application URL. Follow the pattern provided earlier in this section.

```
{
    "applications": [
        {
            "applicationArn": "arn:aws:account-access:us-
west-2:123456789012:application/1234567890abcdef",
            "tenantId": "aa-gyxmap389",
            "createdAt": "2026-03-27T18:31:19+00:00",
            "updatedAt": "2026-03-27T18:31:19+00:00"
        }
    ]
}
```

Setting up a vanity portal URL

For instructions on implementing custom vanity domains, see Regional routing for AWS access portals: Implementing custom vanity domains for IAM Identity Center on the AWS Security Blog. You can adapt these instructions to the URL pattern of the account access portal.

Communicating with your users

Communicate the following to your workforce users:

- The account access portal URL.
- The account access portal is available to your users also as an application in the **Applications** tab in the AWS access portal.
- If you enabled launching the account access portal from an external identity provider portal or another portal outside AWS, include this information in the communication.

User access to AWS accounts

This topic describes how users access the AWS accounts assigned to them with account access manager.

Getting your portal URL

You can access your assigned AWS accounts in several ways:

1. Your administrator might provide you with an account access portal URL (for example, `https://aa-gyxmap389.account-access.us-east-2.app.aws` or a vanity URL).
2. Your administrator might provide you with the URL for the main AWS access portal which displays all AWS applications assigned to you, including the account access portal.
3. Your organization might have enabled you to launch the account access portal from an external identity provider portal or another portal outside AWS.

Access AWS accounts with a web browser

The account access portal displays the AWS accounts you have access to, and the IAM roles you can assume in each account.

To access an account in a browser

1. Navigate to the account access portal URL and when prompted, sign in using your credentials as instructed by your administrator.

   > **Note**
   >
   > To launch the account access portal from the AWS access portal instead, navigate to the **Applications** tab.

2. The browser page displays the AWS accounts you are assigned to. You can search accounts by account name or ID.
3. Expand the account of interest to see all the roles you can assume in the account.
4. Choose the IAM role to sign in with (for example, Developer). A new browser tab opens where you are signed into the account with the chosen role.

Access AWS accounts with the AWS CLI or AWS SDKs

You can access AWS services programmatically by using the AWS Command Line Interface or AWS Software Development Kits (SDKs) with user credentials from IAM Identity Center.

The account access portal provides users with single sign-on access to their AWS accounts for account assignments managed in account access manager. After you sign in to the account access portal, you can get temporary credentials. You can then use the credentials in the AWS CLI or AWS SDKs to access resources in an AWS account.

If you're using the AWS CLI to access AWS services programmatically, you can use the procedures in this topic to initiate access to the AWS CLI. For information about the AWS CLI, see the *AWS Command Line Interface User Guide*.

If you're using the AWS SDKs to access AWS services programmatically, following the procedures in this topic also directly establishes authentication for the AWS SDKs. For information about the AWS SDKs, see the *AWS SDKs and Tools Reference Guide*.

AWS account access with aws login (recommended)

You can use the **aws login** command to gain access to AWS accounts you are assigned to in account access manager. First, install the latest AWS CLI. Then, follow this procedure:

To access an account with AWS CLI

1. In your default browser, sign in to your account access portal, and from there to the target AWS account using one of the assigned IAM roles for the account. Follow the procedure earlier in this topic.
2. On the command line, run the **aws login** command.
3. If you have not set a default Region, the AWS CLI prompts you to specify the AWS Region of your choice (for example, us-east-2). The AWS CLI will remember your choice for future use.
4. The AWS CLI opens a web page in your default browser and prompts you to continue with the active session you just initiated or sign in to a new session.
5. On the web page, choose the tile with the session you initiated earlier in the browser.
6. The browser page confirms that your credentials have been shared successfully and can be used until your session expires. You can now close the tab with the web page and continue working with the AWS CLI using this session.

> **Note**
>
> IAM Identity Center-specific AWS CLI commands such as **aws sso configure** and **aws sso login** don't work with account assignments in account access manager.

AWS account access with access keys

You can use the manual credential refresh method to get temporary credentials for an IAM role assigned to you in a specific AWS account. To do so, you copy and paste the required commands for the temporary credentials. With this method, you must refresh the temporary credentials manually.

You can run AWS CLI commands until your temporary credentials expire.

To get credentials that you manually refresh

1. Sign in to the account access portal as explained in Access AWS accounts with a web browser.
2. Locate the AWS account from which you want to retrieve access credentials and expand it to show the IAM role name (for example Developer).
3. Choose **Generate access key** next to the desired role.

> **Note**
>
> If you do not see any AWS account assignments, it is likely that you've not yet been assigned to any account. In this case, contact your administrator and ask them to assign access to you.

4. In the **Get credentials** dialog box, choose the **MacOS and Linux**, **Windows**, or **PowerShell** tab depending on the operating system on which you installed the AWS CLI.
5. Choose any of the following options:

   - **Option 1: Set AWS environment variables**

     Choose this option to override all credential settings, including any settings in the credentials files and config files. For more information, see Environment variables to configure the AWS CLI in the *AWS Command Line Interface User Guide*.

     To use this option, copy the commands to your clipboard, paste the commands into your AWS CLI terminal window, and then press Enter to set the required environment variables.

   - **Option 2: Use individual values in your AWS service client**

     Choose this option to access AWS resources from an AWS service client. For more information, see Tools to Build on AWS.

     To use this option, copy the values to your clipboard, paste the values into your code, and assign them to the appropriate variables for your SDK. For more information, see the documentation for your specific SDK API.

Creating shortcut links to AWS Management Console destinations

The account access portal offers an option to create a shareable deep link.

To create a shortcut link

1. While signed into the account access portal, choose the **Create shortcut link** button.
2. In the dialog box:

a. Choose an AWS account using the account ID or account name. As you type, a drop-down menu displays matching account IDs and names that you can access. You can choose only an account to which you have access.

b. (Optional) Choose an IAM role from the drop-down list. These are the IAM roles assigned to you for the selected account. If you omit choosing the role, users are prompted to select one assigned to them for the chosen account when using the shortcut link.

> **Note**
>
> You cannot grant new access with shortcut links. Shortcut links work only with the accounts and roles already assigned to the user.

Constructing secure AWS Management Console shortcut links with URL encoding

All parameter values of the URL, including the account ID, IAM role name, and destination URL, must be URL-encoded.

Shortcut links extend the account access portal URL with the following path:

```
/#/console?account_id=[account_ID]&role_name=[role_name]&destination=[destination_URL]
```

The full URL in a commercial AWS Region follows this pattern:

```
https://[Tenant-ID].account-access.[Region].app.aws/#/console?
account_id=[account_ID]&role_name=[role_name]&destination=[destination_URL]
```

Here's an example shortcut link that signs a user into account 123456789012 with the S3FullAccess IAM role name, and takes them to the S3 console home page:

```
https://aa-gyxmap389.account-access.us-east-2.app.aws/#/console?
account_id=123456789012&role_name=S3FullAccess&destination=https%3A%2F
%2Fconsole.aws.amazon.com%2Fs3%2Fhome
```

Considerations

The following considerations apply to the use of shortcut links:

- If you share shortcut links with coworkers, they need to have the same account assignments to be able to use the links in the same way.
- Shortcut links are Regional links. If the referenced Region is experiencing a disruption, the link might not work.
- Shortcut links contain the account ID and role name in plain text. Consider whether your organization's policies restrict where this metadata is stored.

Security in account access manager

This section provides security information specific to account access manager. It complements the information in *Security*, which covers security topics applicable to IAM as a whole.

Identity and access management for account access manager

The following sections describe the permissions you need to:

- Administer account access manager in your organization management account
- Administer account access manager from a delegated administrator account

Administering account access manager from your organization management account

To administer account access manager settings in the AWS organization management account you need the following permissions:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "AAMCreateApplication",
      "Effect": "Allow",
      "Action": "account-access:CreateApplication",
      "Resource": "*"
    },
    {
      "Sid": "AAMApplicationAndEntitlementManagement",
      "Effect": "Allow",
      "Action": [
        "account-access:CreateEntitlement",
```

```
        "account-access:DeleteApplication",
        "account-access:DeleteEntitlement",
        "account-access:GetApplication",
        "account-access:GetEntitlement",
        "account-access:ListEntitlements",
        "account-access:ListTagsForResource",
        "account-access:TagResource",
        "account-access:UntagResource"
      ],
      "Resource": "arn:aws:account-access:*:111122223333:application/*"
    },
    {
      "Sid": "AAMListApplications",
      "Effect": "Allow",
      "Action": "account-access:ListApplications",
      "Resource": "*"
    },
    {
      "Sid": "DependentIdentityCenterActions",
      "Effect": "Allow",
      "Action": [
        "sso:CreateApplication",
        "sso:DeleteApplication",
        "sso:DescribeApplication",
        "sso:DescribeInstance",
        "sso:DescribeRegion",
        "sso:ListInstances",
        "sso:PutApplicationAccessScope",
        "sso:PutApplicationAssignmentConfiguration",
        "sso:PutApplicationAuthenticationMethod",
        "sso:PutApplicationGrant"
      ],
      "Resource": "*"
    },
    {
      "Sid": "DependentIdentityStoreActions",
      "Effect": "Allow",
      "Action": [
        "identitystore:DescribeGroup",
        "identitystore:DescribeUser",
        "identitystore:ListGroupMemberships",
        "sso-directory:DescribeGroup",
        "sso-directory:DescribeGroups",
        "sso-directory:DescribeUser",
```

```
        "sso-directory:DescribeUsers",
        "sso-directory:ListGroupsForUser",
        "sso-directory:ListMembersInGroup",
        "sso-directory:SearchGroups",
        "sso-directory:SearchUsers"
      ],
      "Resource": "*"
    },
    {
      "Sid": "DependentOrganizationsActions",
      "Effect": "Allow",
      "Action": [
        "organizations:DescribeAccount",
        "organizations:DescribeOrganization",
        "organizations:ListAccounts",
        "organizations:ListAccountsForParent",
        "organizations:ListAWSServiceAccessForOrganization",
        "organizations:ListDelegatedAdministrators",
        "organizations:ListOrganizationalUnitsForParent",
        "organizations:ListRoots"
      ],
      "Resource": "*"
    },
    {
      "Sid": "DependentKMSActions",
      "Effect": "Allow",
      "Action": "kms:Decrypt",
      "Resource": "*"
    },
    {
      "Sid": "CreateServiceLinkedRole",
      "Effect": "Allow",
      "Action": "iam:CreateServiceLinkedRole",
      "Resource": "arn:aws:iam::111122223333:role/aws-service-role/account-
access.amazonaws.com/AWSServiceRoleForAccountAccessManager",
      "Condition": {
        "StringEquals": {
          "iam:AWSServiceName": "account-access.amazonaws.com"
        }
      }
    }
  ]
}
```

Optional: To constrain `account-access:CreateApplication` by tag, replace the AAMCreateApplication statement with:

```
{
  "Sid": "AAMCreateApplicationConstrainedByTag",
  "Effect": "Allow",
  "Action": "account-access:CreateApplication",
  "Resource": "*",
  "Condition": {
    "StringEquals": {
      "aws:RequestTag/Environment": "Production"
    },
    "ForAllValues:StringEquals": {
      "aws:TagKeys": [
        "Environment"
      ]
    }
  }
}
```

Optional: To manage and register delegated administrators for account access manager, add:

```
{
  "Sid": "ManageDelegatedAdministrator",
  "Effect": "Allow",
  "Action": [
    "organizations:DeregisterDelegatedAdministrator",
    "organizations:RegisterDelegatedAdministrator"
  ],
  "Resource": "*",
  "Condition": {
    "StringEquals": {
      "organizations:ServicePrincipal": "account-access.amazonaws.com"
    }
  }
}
```

To assign IAM roles to your workforce users and groups from the AWS organization management account without administering account access manager settings you need the following permissions:

```
{
```

```
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "AAMManageEntitlementsOnly",
      "Effect": "Allow",
      "Action": [
        "account-access:CreateEntitlement",
        "account-access:DeleteEntitlement",
        "account-access:GetApplication",
        "account-access:GetEntitlement",
        "account-access:ListEntitlements"
      ],
      "Resource": "arn:aws:account-access:*:111122223333:application/*"
    },
    {
      "Sid": "AAMListApplications",
      "Effect": "Allow",
      "Action": "account-access:ListApplications",
      "Resource": "*"
    },
    {
      "Sid": "DependentIdentityCenterActions",
      "Effect": "Allow",
      "Action": "sso:ListInstances",
      "Resource": "*"
    },
    {
      "Sid": "DependentIdentityStoreActions",
      "Effect": "Allow",
      "Action": [
        "identitystore:DescribeGroup",
        "identitystore:DescribeUser",
        "identitystore:ListGroupMemberships",
        "sso-directory:DescribeGroup",
        "sso-directory:DescribeGroups",
        "sso-directory:DescribeUser",
        "sso-directory:DescribeUsers",
        "sso-directory:ListGroupsForUser",
        "sso-directory:ListMembersInGroup",
        "sso-directory:SearchGroups",
        "sso-directory:SearchUsers"
      ],
      "Resource": "*"
    },
```

```
    {
      "Sid": "DependentOrganizationsActions",
      "Effect": "Allow",
      "Action": [
        "organizations:DescribeAccount",
        "organizations:DescribeOrganization",
        "organizations:ListAccounts",
        "organizations:ListAccountsForParent",
        "organizations:ListAWSServiceAccessForOrganization",
        "organizations:ListDelegatedAdministrators",
        "organizations:ListOrganizationalUnitsForParent",
        "organizations:ListRoots"
      ],
      "Resource": "*"
    }
  ]
}
```

Administering account access manager in a delegated administration account

To administer account access manager settings from a delegated administration account you need the following permissions:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "AAMDelegatedAdminManagement",
      "Effect": "Allow",
      "Action": [
        "account-access:CreateEntitlement",
        "account-access:DeleteEntitlement",
        "account-access:GetApplication",
        "account-access:GetEntitlement",
        "account-access:ListEntitlements",
        "account-access:ListTagsForResource",
        "account-access:TagResource",
        "account-access:UntagResource"
      ],
      "Resource": "arn:aws:account-access:*:111122223333:application/*"
    },
    {
      "Sid": "AAMListApplications",
```

```
      "Effect": "Allow",
      "Action": "account-access:ListApplications",
      "Resource": "*"
    },
    {
      "Sid": "DependentIdentityCenterActions",
      "Effect": "Allow",
      "Action": [
        "sso:DescribeApplication",
        "sso:DescribeInstance",
        "sso:DescribeRegion",
        "sso:ListInstances"
      ],
      "Resource": "*"
    },
    {
      "Sid": "DependentIdentityStoreActions",
      "Effect": "Allow",
      "Action": [
        "identitystore:DescribeGroup",
        "identitystore:DescribeUser",
        "identitystore:ListGroupMemberships",
        "sso-directory:DescribeGroup",
        "sso-directory:DescribeGroups",
        "sso-directory:DescribeUser",
        "sso-directory:DescribeUsers",
        "sso-directory:ListGroupsForUser",
        "sso-directory:ListMembersInGroup",
        "sso-directory:SearchGroups",
        "sso-directory:SearchUsers"
      ],
      "Resource": "*"
    },
    {
      "Sid": "DependentOrganizationsActions",
      "Effect": "Allow",
      "Action": [
        "organizations:DescribeAccount",
        "organizations:DescribeOrganization",
        "organizations:ListAccounts",
        "organizations:ListAccountsForParent",
        "organizations:ListAWSServiceAccessForOrganization",
        "organizations:ListDelegatedAdministrators",
        "organizations:ListOrganizationalUnitsForParent",
```

```
        "organizations:ListRoots"
      ],
      "Resource": "*"
    }
  ]
}
```

To assign IAM roles to workforce users and groups from a delegated administration account without administering account access manager settings you need the following permissions:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "AAMManageEntitlementsOnly",
      "Effect": "Allow",
      "Action": [
        "account-access:CreateEntitlement",
        "account-access:DeleteEntitlement",
        "account-access:GetApplication",
        "account-access:GetEntitlement",
        "account-access:ListEntitlements"
      ],
      "Resource": "arn:aws:account-access:*:111122223333:application/*"
    },
    {
      "Sid": "AAMListApplications",
      "Effect": "Allow",
      "Action": "account-access:ListApplications",
      "Resource": "*"
    },
    {
      "Sid": "DependentIdentityCenterActions",
      "Effect": "Allow",
      "Action": "sso:ListInstances",
      "Resource": "*"
    },
    {
      "Sid": "DependentIdentityStoreActions",
      "Effect": "Allow",
      "Action": [
        "identitystore:DescribeGroup",
        "identitystore:DescribeUser",
```

```
        "identitystore:ListGroupMemberships",
        "sso-directory:DescribeGroup",
        "sso-directory:DescribeGroups",
        "sso-directory:DescribeUser",
        "sso-directory:DescribeUsers",
        "sso-directory:ListGroupsForUser",
        "sso-directory:ListMembersInGroup",
        "sso-directory:SearchGroups",
        "sso-directory:SearchUsers"
      ],
      "Resource": "*"
    },
    {
      "Sid": "DependentOrganizationsActions",
      "Effect": "Allow",
      "Action": [
        "organizations:DescribeAccount",
        "organizations:DescribeOrganization",
        "organizations:ListAccounts",
        "organizations:ListAccountsForParent",
        "organizations:ListAWSServiceAccessForOrganization",
        "organizations:ListDelegatedAdministrators",
        "organizations:ListOrganizationalUnitsForParent",
        "organizations:ListRoots"
      ],
      "Resource": "*"
    }
  ]
}
```

Data protection in account access manager

This section complements the information provided in Data protection in AWS Identity and Access Management with additional details specific to account access manager.

Use of IAM Identity Center user and group data

Account access manager uses user and group data from IAM Identity Center to manage account assignments. However, account access manager stores and logs only AWS-generated identifiers (user ID and group ID) — it does not store or log user names, email addresses, or other personal attributes.

Logging and monitoring in account access manager

Account access manager uses its own API namespace (`account-access`) and logs API calls through CloudTrail.

For more information about CloudTrail, see the AWS CloudTrail User Guide.

Quotas and limits in account access manager

The following tables describe quotas within account access manager. Quota increase requests must come from a management or delegated administrator account. To increase a quota, see Requesting a quota increase.

Group assignment quota

Resource	Default quota	Can be increased
Maximum number of groups assigned to an IAM role	20	Yes

Throttle limits

Resource	Default quota	Can be increased
Account access API	The account access API has a collective throttle limit of 20 transactions per second (TPS). For read APIs, you can open a support case to request a limit increase. The write API operations have a limit of 15 outstanding asynchron ous calls. This limit cannot be increased.	Yes

Code examples for IAM using AWS SDKs

The following code examples show how to use IAM with an AWS software development kit (SDK).

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Code examples for IAM using AWS SDKs

The following code examples show how to use IAM with an AWS software development kit (SDK).

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Hello IAM

The following code examples show how to get started using IAM.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
namespace IAMActions;

public class HelloIAM
{
    static async Task Main(string[] args)
    {
        // Getting started with AWS Identity and Access Management (IAM). List
        // the policies for the account.
        var iamClient = new AmazonIdentityManagementServiceClient();
```

```
        var listPoliciesPaginator = iamClient.Paginators.ListPolicies(new
 ListPoliciesRequest());
        var policies = new List<ManagedPolicy>();

        await foreach (var response in listPoliciesPaginator.Responses)
        {
            policies.AddRange(response.Policies);
        }

        Console.WriteLine("Here are the policies defined for your account:\n");
        policies.ForEach(policy =>
        {
            Console.WriteLine($"Created:
 {policy.CreateDate}\t{policy.PolicyName}\t{policy.Description}");
        });
    }
}
```

- For API details, see ListPolicies in *AWS SDK for .NET API Reference*.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Code for the CMakeLists.txt CMake file.

```
# Set the minimum required version of CMake for this project.
cmake_minimum_required(VERSION 3.13)

# Set the AWS service components used by this project.
set(SERVICE_COMPONENTS iam)

# Set this project's name.
project("hello_iam")
```

```
# Set the C++ standard to use to build this target.
# At least C++ 11 is required for the AWS SDK for C++.
set(CMAKE_CXX_STANDARD 11)

# Use the MSVC variable to determine if this is a Windows build.
set(WINDOWS_BUILD ${MSVC})

if (WINDOWS_BUILD) # Set the location where CMake can find the installed
 libraries for the AWS SDK.
    string(REPLACE ";" "/aws-cpp-sdk-all;" SYSTEM_MODULE_PATH
 "${CMAKE_SYSTEM_PREFIX_PATH}/aws-cpp-sdk-all")
    list(APPEND CMAKE_PREFIX_PATH ${SYSTEM_MODULE_PATH})
endif ()

# Find the AWS SDK for C++ package.
find_package(AWSSDK REQUIRED COMPONENTS ${SERVICE_COMPONENTS})

if (WINDOWS_BUILD AND AWSSDK_INSTALL_AS_SHARED_LIBS)
    # Copy relevant AWS SDK for C++ libraries into the current binary directory
 for running and debugging.

    # set(BIN_SUB_DIR "/Debug") # if you are building from the command line you
 may need to uncomment this
    # and set the proper subdirectory to the executables' location.

    AWSSDK_CPY_DYN_LIBS(SERVICE_COMPONENTS ""
 ${CMAKE_CURRENT_BINARY_DIR}${BIN_SUB_DIR})
endif ()

add_executable(${PROJECT_NAME}
        hello_iam.cpp)

target_link_libraries(${PROJECT_NAME}
        ${AWSSDK_LINK_LIBRARIES})
```

Code for the iam.cpp source file.

```
#include <aws/core/Aws.h>
#include <aws/iam/IAMClient.h>
#include <aws/iam/model/ListPoliciesRequest.h>
#include <iostream>
```

```
#include <iomanip>

/*
 *  A "Hello IAM" starter application which initializes an AWS Identity and
 Access Management (IAM) client
 *  and lists the IAM policies.
 *
 *  main function
 *
 *  Usage: 'hello_iam'
 *
 */

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Learn the basics of IAM with an AWS SDK

The following code examples show how to create a user and assume a role.

> **Warning**
>
> To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as AWS IAM Identity Center.

- Create a user with no permissions.
- Create a role that grants permission to list Amazon S3 buckets for the account.
- Add a policy to let the user assume the role.
- Assume the role and list S3 buckets using temporary credentials, then clean up resources.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create functions that wrap IAM user actions.

```
/*
  To run this Java V2 code example, set up your development environment,
 including your credentials.

  For information, see this documentation topic:

  https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-
started.html

  This example performs these operations:

  1. Creates a user that has no permissions.
  2. Creates a role and policy that grants Amazon S3 permissions.
  3. Creates a role.
  4. Grants the user permissions.
  5. Gets temporary credentials by assuming the role.  Creates an Amazon S3
 Service client object with the temporary credentials.
  6. Deletes the resources.
 */

> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create an IAM user and a role that grants permission to list Amazon S3 buckets. The user has rights only to assume the role. After assuming the role, use temporary credentials to list buckets for the account.

```
import {
  CreateUserCommand,
  GetUserCommand,
  CreateAccessKeyCommand,
  CreatePolicyCommand,
  CreateRoleCommand,
  AttachRolePolicyCommand,
  DeleteAccessKeyCommand,
  DeleteUserCommand,
  DeleteRoleCommand,
  DeletePolicyCommand,
  DetachRolePolicyCommand,
  IAMClient,
} from "@aws-sdk/client-iam";
import { ListBucketsCommand, S3Client } from "@aws-sdk/client-s3";
import { AssumeRoleCommand, STSClient } from "@aws-sdk/client-sts";
import { retry } from "@aws-doc-sdk-examples/lib/utils/util-timers.js";
import { ScenarioInput } from "@aws-doc-sdk-examples/lib/scenario/index.js";

// Set the parameters.
const iamClient = new IAMClient({});
const userName = "iam_basic_test_username";
const policyName = "iam_basic_test_policy";
const roleName = "iam_basic_test_role";

/**
 * Create a new IAM user. If the user already exists, give
 * the option to delete and re-create it.
 * @param {string} name
 */
export const createUser = async (name, confirmAll = false) => {
  try {
    const { User } = await iamClient.send(
      new GetUserCommand({ UserName: name }),
    );
    const input = new ScenarioInput(
      "deleteUser",
      "Do you want to delete and remake this user?",
      { type: "confirm" },
```

```
    );
    const deleteUser = await input.handle({}, { confirmAll });
    // If the user exists, and you want to delete it, delete the user
    // and then create it again.
    if (deleteUser) {
      await iamClient.send(new DeleteUserCommand({ UserName: User.UserName }));
      await iamClient.send(new CreateUserCommand({ UserName: name }));
    } else {
      console.warn(
        `${name} already exists. The scenario may not work as expected.`,
      );
      return User;
    }
  } catch (caught) {
    // If there is no user by that name, create one.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create an IAM user and a role that grants permission to list Amazon S3 buckets. The user has rights only to assume the role. After assuming the role, use temporary credentials to list buckets for the account.

```
import json
import sys
import time
from uuid import uuid4

import boto3
from botocore.exceptions import ClientError

def progress_bar(seconds):
    """Shows a simple progress bar in the command window."""
    for _ in range(seconds):
        time.sleep(1)
        print(".", end="")
        sys.stdout.flush()
    print()

def setup(iam_resource):
    """
    Creates a new user with no permissions.
```

```
    Creates an access key pair for the user.
    Creates a role with a policy that lets the user assume the role.
    Creates a policy that allows listing Amazon S3 buckets.
    Attaches the policy to the role.
    Creates an inline policy for the user that lets the user assume the role.

    :param iam_resource: A Boto3 AWS Identity and Access Management (IAM)
resource
                         that has permissions to create users, roles, and
policies
                         in the account.
    :return: The newly created user, user key, and role.
    """

Actions for IAM using AWS SDKs

The following code examples demonstrate how to perform individual IAM actions with AWS SDKs. Each example includes a link to GitHub, where you can find instructions for setting up and running the code.

These excerpts call the IAM API and are code excerpts from larger programs that must be run in context. You can see actions in context in Scenarios for IAM using AWS SDKs.

The following examples include only the most commonly used actions. For a complete list, see the AWS Identity and Access Management API Reference.

Examples

- Use AddClientIdToOpenIdConnectProvider with a CLI
- Use AddRoleToInstanceProfile with a CLI
- Use AddUserToGroup with a CLI
- Use AttachGroupPolicy with a CLI
- Use AttachRolePolicy with an AWS SDK or CLI
- Use AttachUserPolicy with an AWS SDK or CLI
- Use ChangePassword with a CLI
- Use CreateAccessKey with an AWS SDK or CLI
- Use CreateAccountAlias with an AWS SDK or CLI
- Use CreateGroup with an AWS SDK or CLI
- Use CreateInstanceProfile with an AWS SDK or CLI
- Use CreateLoginProfile with a CLI
- Use CreateOpenIdConnectProvider with a CLI
- Use CreatePolicy with an AWS SDK or CLI
- Use CreatePolicyVersion with an AWS SDK or CLI
- Use CreateRole with an AWS SDK or CLI
- Use CreateSAMLProvider with an AWS SDK or CLI
- Use CreateServiceLinkedRole with an AWS SDK or CLI
- Use CreateUser with an AWS SDK or CLI
- Use CreateVirtualMfaDevice with a CLI
- Use DeactivateMfaDevice with a CLI
- Use DeleteAccessKey with an AWS SDK or CLI
- Use DeleteAccountAlias with an AWS SDK or CLI

- Use DeleteAccountPasswordPolicy with a CLI
- Use DeleteGroup with an AWS SDK or CLI
- Use DeleteGroupPolicy with a CLI
- Use DeleteInstanceProfile with an AWS SDK or CLI
- Use DeleteLoginProfile with a CLI
- Use DeleteOpenIdConnectProvider with a CLI
- Use DeletePolicy with an AWS SDK or CLI
- Use DeletePolicyVersion with an AWS SDK or CLI
- Use DeleteRole with an AWS SDK or CLI
- Use DeleteRolePermissionsBoundary with a CLI
- Use DeleteRolePolicy with an AWS SDK or CLI
- Use DeleteSAMLProvider with an AWS SDK or CLI
- Use DeleteServerCertificate with an AWS SDK or CLI
- Use DeleteServiceLinkedRole with an AWS SDK or CLI
- Use DeleteSigningCertificate with a CLI
- Use DeleteUser with an AWS SDK or CLI
- Use DeleteUserPermissionsBoundary with a CLI
- Use DeleteUserPolicy with an AWS SDK or CLI
- Use DeleteVirtualMfaDevice with a CLI
- Use DetachGroupPolicy with a CLI
- Use DetachRolePolicy with an AWS SDK or CLI
- Use DetachUserPolicy with an AWS SDK or CLI
- Use EnableMfaDevice with a CLI
- Use GenerateCredentialReport with an AWS SDK or CLI
- Use GenerateServiceLastAccessedDetails with a CLI
- Use GetAccessKeyLastUsed with an AWS SDK or CLI
- Use GetAccountAuthorizationDetails with an AWS SDK or CLI
- Use GetAccountPasswordPolicy with an AWS SDK or CLI
- Use GetAccountSummary with an AWS SDK or CLI

- Use GetContextKeysForCustomPolicy with a CLI
- Use GetContextKeysForPrincipalPolicy with a CLI
- Use GetCredentialReport with an AWS SDK or CLI
- Use GetGroup with a CLI
- Use GetGroupPolicy with a CLI

Use `AddClientIdToOpenIdConnectProvider` with a CLI

The following code examples show how to use `AddClientIdToOpenIdConnectProvider`.

CLI

AWS CLI

To add a client ID (audience) to an Open-ID Connect (OIDC) provider

The following `add-client-id-to-open-id-connect-provider` command adds the client ID `my-application-ID` to the OIDC provider named `server.example.com`.

```
aws iam add-client-id-to-open-id-connect-provider \
    --client-id my-application-ID \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com
```

This command produces no output.

To create an OIDC provider, use the `create-open-id-connect-provider` command.

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see AddClientIdToOpenIdConnectProvider in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command adds the client ID (or audience) `my-application-ID` to the existing OIDC provider named `server.example.com`.

```
Add-IAMClientIDToOpenIDConnectProvider -ClientID "my-application-ID"
 -OpenIDConnectProviderARN "arn:aws:iam::123456789012:oidc-provider/
server.example.com"
```

- For API details, see AddClientIdToOpenIdConnectProvider in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command adds the client ID (or audience) `my-application-ID` to the existing OIDC provider named `server.example.com`.

```
Add-IAMClientIDToOpenIDConnectProvider -ClientID "my-application-ID"
 -OpenIDConnectProviderARN "arn:aws:iam::123456789012:oidc-provider/
server.example.com"
```

- For API details, see AddClientIdToOpenIdConnectProvider in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `AddRoleToInstanceProfile` with a CLI

The following code examples show how to use `AddRoleToInstanceProfile`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Creating a container service for virtual machine instances
- Getting started with managed streaming
- Run CPU stress tests on virtual machine instances using fault injection

CLI

AWS CLI

To add a role to an instance profile

The following `add-role-to-instance-profile` command adds the role named `S3Access` to the instance profile named `Webserver`.

```
aws iam add-role-to-instance-profile \
    --role-name S3Access \
    --instance-profile-name Webserver
```

This command produces no output.

To create an instance profile, use the `create-instance-profile` command.

For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the *AWS IAM User Guide*.

- For API details, see AddRoleToInstanceProfile in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command adds the role named `S3Access` to an existing instance profile named `webserver`. To create the instance profile, use the `New-IAMInstanceProfile` command. After you create the instance profile and associate it with a role using this command, you can attach it to an EC2 instance. To do that, use the `New-EC2Instance` cmdlet with either the `InstanceProfile_Arn` or the `InstanceProfile-Name` parameter to launch the new instance.

```
Add-IAMRoleToInstanceProfile -RoleName "S3Access" -InstanceProfileName
 "webserver"
```

- For API details, see AddRoleToInstanceProfile in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command adds the role named `S3Access` to an existing instance profile named `webserver`. To create the instance profile, use the `New-IAMInstanceProfile` command. After you create the instance profile and associate it with a role using this command, you can attach it to an EC2 instance. To do that, use the `New-EC2Instance` cmdlet with either the `InstanceProfile_Arn` or the `InstanceProfile-Name` parameter to launch the new instance.

```
Add-IAMRoleToInstanceProfile -RoleName "S3Access" -InstanceProfileName
 "webserver"
```

- For API details, see AddRoleToInstanceProfile in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `AddUserToGroup` with a CLI

The following code examples show how to use `AddUserToGroup`.

CLI

AWS CLI

To add a user to an IAM group

The following `add-user-to-group` command adds an IAM user named Bob to the IAM group named `Admins`.

```
aws iam add-user-to-group \
    --user-name Bob \
```

```
    --group-name Admins
```

This command produces no output.

For more information, see Adding and removing users in an IAM user group in the *AWS IAM User Guide*.

- For API details, see AddUserToGroup in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command adds the user named Bob to the group named Admins.

```
Add-IAMUserToGroup -UserName "Bob" -GroupName "Admins"
```

- For API details, see AddUserToGroup in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command adds the user named Bob to the group named Admins.

```
Add-IAMUserToGroup -UserName "Bob" -GroupName "Admins"
```

- For API details, see AddUserToGroup in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `AttachGroupPolicy` with a CLI

The following code examples show how to use `AttachGroupPolicy`.

CLI

AWS CLI

To attach a managed policy to an IAM group

The following `attach-group-policy` command attaches the AWS managed policy named `ReadOnlyAccess` to the IAM group named `Finance`.

```
aws iam attach-group-policy \
    --policy-arn arn:aws:iam::aws:policy/ReadOnlyAccess \
    --group-name Finance
```

This command produces no output.

For more information, see Managed policies and inline policies in the *AWS IAM User Guide*.

- For API details, see AttachGroupPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example attaches the customer managed policy named `TesterPolicy` to the IAM group `Testers`. The users in that group are immediately affected by the permissions defined in the default version of that policy.

```
Register-IAMGroupPolicy -GroupName Testers -PolicyArn
 arn:aws:iam::123456789012:policy/TesterPolicy
```

Example 2: This example attaches the AWS managed policy named `AdministratorAccess` to the IAM group `Admins`. The users in that group are immediately affected by the permissions defined in the latest version of that policy.

```
Register-IAMGroupPolicy -GroupName Admins -PolicyArn arn:aws:iam::aws:policy/
AdministratorAccess
```

- For API details, see AttachGroupPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example attaches the customer managed policy named `TesterPolicy` to the IAM group `Testers`. The users in that group are immediately affected by the permissions defined in the default version of that policy.

```
Register-IAMGroupPolicy -GroupName Testers -PolicyArn
 arn:aws:iam::123456789012:policy/TesterPolicy
```

Example 2: This example attaches the AWS managed policy named `AdministratorAccess` to the IAM group `Admins`. The users in that group are immediately affected by the permissions defined in the latest version of that policy.

```
Register-IAMGroupPolicy -GroupName Admins -PolicyArn arn:aws:iam::aws:policy/
AdministratorAccess
```

- For API details, see AttachGroupPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `AttachRolePolicy` with an AWS SDK or CLI

The following code examples show how to use `AttachRolePolicy`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Configure container service connectivity
- Create a container task for the serverless launch type
- Create a rest API with function proxy integration
- Creating a container service for virtual machine instances
- Creating a managed monitoring workspace
- Creating a monitoring dashboard with function name as a variable
- Creating your first serverless function
- Getting started with configuration management
- Getting started with internet of things device protection
- Getting started with machine learning feature stores
- Getting started with managed kubernetes clusters
- Getting started with managed streaming
- Getting started with workflow orchestration
- Manage roles

- Moving hardcoded secrets to secure secret storage
- Run CPU stress tests on virtual machine instances using fault injection
- Setting up systems management
- Using property variables in monitoring dashboards to monitor multiple serverless functions
- Work with Streams and Time-to-Live

.NET

        request.SetPolicyArn(policyArn);

        Aws::IAM::Model::AttachRolePolicyOutcome outcome =
     iam.AttachRolePolicy(request);
        if (!outcome.IsSuccess()) {
            std::cerr << "Failed to attach policy " << policyArn << " to role " <<
                      roleName << ": " << outcome.GetError().GetMessage() <<
     std::endl;
        }
        else {
            std::cout << "Successfully attached policy " << policyArn << " to role "
     <<
                      roleName << std::endl;
        }

        return outcome.IsSuccess();
    }
```

- For API details, see AttachRolePolicy in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To attach a managed policy to an IAM role

The following `attach-role-policy` command attaches the AWS managed policy named `ReadOnlyAccess` to the IAM role named `ReadOnlyRole`.

```
aws iam attach-role-policy \
    --policy-arn arn:aws:iam::aws:policy/ReadOnlyAccess \
    --role-name ReadOnlyRole
```

This command produces no output.

For more information, see Managed policies and inline policies in the *AWS IAM User Guide*.

- For API details, see AttachRolePolicy in *AWS CLI Command Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `AttachUserPolicy` with an AWS SDK or CLI

The following code examples show how to use `AttachUserPolicy`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Create read-only and read-write users

CLI

AWS CLI

To attach a managed policy to an IAM user

The following `attach-user-policy` command attaches the AWS managed policy named `AdministratorAccess` to the IAM user named `Alice`.

```
aws iam attach-user-policy \
    --policy-arn arn:aws:iam::aws:policy/AdministratorAccess \
    --user-name Alice
```

This command produces no output.

For more information, see Managed policies and inline policies in the *AWS IAM User Guide*.

- For API details, see AttachUserPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example attaches the AWS managed policy named `AmazonCognitoPowerUser` to the IAM user Bob. The user is immediately affected by the permissions defined in the latest version of that policy.

```
Register-IAMUserPolicy -UserName Bob -PolicyArn arn:aws:iam::aws:policy/
AmazonCognitoPowerUser
```

- For API details, see AttachUserPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example attaches the AWS managed policy named `AmazonCognitoPowerUser` to the IAM user Bob. The user is immediately affected by the permissions defined in the latest version of that policy.

```
Register-IAMUserPolicy -UserName Bob -PolicyArn arn:aws:iam::aws:policy/
AmazonCognitoPowerUser
```

- For API details, see AttachUserPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ChangePassword` with a CLI

The following code examples show how to use `ChangePassword`.

CLI

AWS CLI

To change the password for your IAM user

To change the password for your IAM user, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains your old and new passwords. Using this method, you can use strong passwords with non-alphanumeric characters. It can be difficult to use passwords with non-alphanumeric characters when you pass them as command line parameters. To use the `--cli-input-json` parameter, start by using the `change-password` command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam change-password \
    --generate-cli-skeleton > change-password.json
```

The previous command creates a JSON file called change-password.json that you can use to fill in your old and new passwords. For example, the file might look like the following.

```
{
```

```
    "OldPassword": "3s0K_;xh4~8XXI",
    "NewPassword": "]35d/{pB9Fo9wJ"
}
```

Next, to change your password, use the `change-password` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `change-password` command uses the `--cli-input-json` parameter with a JSON file called change-password.json.

```
aws iam change-password \
    --cli-input-json file://change-password.json
```

This command produces no output.

This command can be called by IAM users only. If this command is called using AWS account (root) credentials, the command returns an `InvalidUserType` error.

For more information, see How an IAM user changes their own password in the *AWS IAM User Guide*.

- For API details, see ChangePassword in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command changes the password for the user that is running the command. This command can be called by IAM users only. If this command is called when you are signed-in with AWS account (root) credentials, the command returns an `InvalidUserType` error.

```
Edit-IAMPassword -OldPassword "MyOldP@ssw0rd" -NewPassword "MyNewP@ssw0rd"
```

- For API details, see ChangePassword in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command changes the password for the user that is running the command. This command can be called by IAM users only. If this command is called when you are signed-in with AWS account (root) credentials, the command returns an `InvalidUserType` error.

```
Edit-IAMPassword -OldPassword "MyOldP@ssw0rd" -NewPassword "MyNewP@ssw0rd"
```

- For API details, see ChangePassword in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `CreateAccessKey` with an AWS SDK or CLI

The following code examples show how to use `CreateAccessKey`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Create read-only and read-write users
- Manage access keys

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
Aws::String AwsDoc::IAM::createAccessKey(const Aws::String &userName,
                                         const Aws::Client::ClientConfiguration
 &clientConfig) {
    Aws::IAM::IAMClient iam(clientConfig);
```

```
    Aws::IAM::Model::CreateAccessKeyRequest request;
    request.SetUserName(userName);

    Aws::String result;
    Aws::IAM::Model::CreateAccessKeyOutcome outcome =
 iam.CreateAccessKey(request);
    if (!outcome.IsSuccess()) {
        std::cerr << "Error creating access key for IAM user " << userName
                  << ":" << outcome.GetError().GetMessage() << std::endl;
    }
    else {
        const auto &accessKey = outcome.GetResult().GetAccessKey();
        std::cout << "Successfully created access key for IAM user " <<
                  userName << std::endl << "  aws_access_key_id = " <<
                  accessKey.GetAccessKeyId() << std::endl <<
                  " aws_secret_access_key = " << accessKey.GetSecretAccessKey()
 <<
                  std::endl;
        result = accessKey.GetAccessKeyId();
    }

    return result;
}
```

- For API details, see CreateAccessKey in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To create an access key for an IAM user

The following `create-access-key` command creates an access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam create-access-key \
    --user-name Bob
```

Output:

```
{
```

```
    "AccessKey": {
        "UserName": "Bob",
        "Status": "Active",
        "CreateDate": "2015-03-09T18:39:23.411Z",
        "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYzEXAMPLEKEY",
        "AccessKeyId": "AKIAIOSFODNN7EXAMPLE"
    }
}
```

Store the secret access key in a secure location. If it is lost, it cannot be recovered, and you must create a new access key.

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see CreateAccessKey in *AWS CLI Command Reference*.

```
suspend fun createIAMAccessKey(user: String?): String {
```

```
    val request =
        CreateAccessKeyRequest {
            userName = user
        }

    IamClient.fromEnvironment { region = "AWS_GLOBAL" }.use { iamClient ->
        val response = iamClient.createAccessKey(request)
        return response.accessKey?.accessKeyId.toString()
    }
}
```

- For API details, see CreateAccessKey in *AWS SDK for Kotlin API reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a new access key and secret access key pair and assigns it to the user `David`. Ensure that you save the `AccessKeyId` and `SecretAccessKey` values to a file because this is the only time you can obtain the `SecretAccessKey`. You cannot retrieve it later. If you lose the secret key, you must create a new access key pair.

```
New-IAMAccessKey -UserName David
```

Output:

```
AccessKeyId     : AKIAIOSFODNN7EXAMPLE
CreateDate      : 4/13/2015 1:00:42 PM
SecretAccessKey : wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY
Status          : Active
UserName        : David
```

- For API details, see CreateAccessKey in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a new access key and secret access key pair and assigns it to the user `David`. Ensure that you save the `AccessKeyId` and `SecretAccessKey` values to a file because this is the only time you can obtain the `SecretAccessKey`. You cannot retrieve it later. If you lose the secret key, you must create a new access key pair.

```
New-IAMAccessKey -UserName David
```

Output:

```
AccessKeyId     : AKIAIOSFODNN7EXAMPLE
CreateDate      : 4/13/2015 1:00:42 PM
SecretAccessKey : wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY
Status          : Active
UserName        : David
```

            guard let accessKey = output.accessKey else {
                throw ServiceHandlerError.keyError
            }
            return accessKey
        } catch {
            print("ERROR: createAccessKey:", dump(error))
            throw error
        }
    }
```

- For API details, see CreateAccessKey in *AWS SDK for Swift API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `CreateAccountAlias` with an AWS SDK or CLI

The following code examples show how to use `CreateAccountAlias`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage your account

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::createAccountAlias(const Aws::String &aliasName,
                                     const Aws::Client::ClientConfiguration
 &clientConfig) {
    Aws::IAM::IAMClient iam(clientConfig);
    Aws::IAM::Model::CreateAccountAliasRequest request;
    request.SetAccountAlias(aliasName);

    Aws::IAM::Model::CreateAccountAliasOutcome outcome = iam.CreateAccountAlias(
            request);
    if (!outcome.IsSuccess()) {
        std::cerr << "Error creating account alias " << aliasName << ": "
                  << outcome.GetError().GetMessage() << std::endl;
    }
    else {
        std::cout << "Successfully created account alias " << aliasName <<
                  std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see CreateAccountAlias in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To create an account alias

The following `create-account-alias` command creates the alias `examplecorp` for your AWS account.

```
aws iam create-account-alias \
    --account-alias examplecorp
```

This command produces no output.

For more information, see Your AWS account ID and its alias in the *AWS IAM User Guide*.

- For API details, see CreateAccountAlias in *AWS CLI Command Reference*.

Create the account alias.

```
import { CreateAccountAliasCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} alias - A unique name for the account alias.
 * @returns
 */
export const createAccountAlias = (alias) => {
  const command = new CreateAccountAliasCommand({
    AccountAlias: alias,
  });

  return client.send(command);
};
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see CreateAccountAlias in *AWS SDK for JavaScript API Reference*.

SDK for JavaScript (v2)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// Load the AWS SDK for Node.js
var AWS = require("aws-sdk");
// Set the region
AWS.config.update({ region: "REGION" });

// Create the IAM service object
var iam = new AWS.IAM({ apiVersion: "2010-05-08" });

iam.createAccountAlias({ AccountAlias: process.argv[2] }, function (err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});

SDK for Kotlin

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
suspend fun createIAMAccountAlias(alias: String) {
```

```
    val request =
        CreateAccountAliasRequest {
            accountAlias = alias
        }

    IamClient.fromEnvironment { region = "AWS_GLOBAL" }.use { iamClient ->
        iamClient.createAccountAlias(request)
        println("Successfully created account alias named $alias")
    }
}
```

- For API details, see CreateAccountAlias in *AWS SDK for Kotlin API reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example changes the account alias for your AWS account to `mycompanyaws`. The address of the user logon page chages to https://mycompanyaws.signin.aws.amazon.com/console. The original URL using your account ID number instead of the alias (https://<accountidnumber>.signin.aws.amazon.com/console) continues to work. However, any previously defined alias-based URLs stop working.

```
New-IAMAccountAlias -AccountAlias mycompanyaws
```

- For API details, see CreateAccountAlias in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example changes the account alias for your AWS account to `mycompanyaws`. The address of the user logon page chages to https://mycompanyaws.signin.aws.amazon.com/console. The original URL using your account ID number instead of the alias (https://<accountidnumber>.signin.aws.amazon.com/console) continues to work. However, any previously defined alias-based URLs stop working.

```
New-IAMAccountAlias -AccountAlias mycompanyaws
```

- For API details, see CreateAccountAlias in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Python

Use `CreateGroup` with an AWS SDK or CLI

The following code examples show how to use `CreateGroup`.

CLI

AWS CLI

To create an IAM group

The following `create-group` command creates an IAM group named `Admins`.

```
aws iam create-group \
    --group-name Admins
```

Output:

```
{
    "Group": {
        "Path": "/",
        "CreateDate": "2015-03-09T20:30:24.940Z",
        "GroupId": "AIDGPMS9RO4H3FEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:group/Admins",
        "GroupName": "Admins"
    }
}
```

For more information, see Creating IAM user groups in the *AWS IAM User Guide*.

- For API details, see CreateGroup in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import { CreateGroupCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
```

```
 *
 * @param {string} groupName
 */
export const createGroup = async (groupName) => {
  const command = new CreateGroupCommand({ GroupName: groupName });

  const response = await client.send(command);
  console.log(response);
  return response;
};
```

- For API details, see CreateGroup in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a new IAM group named `Developers`.

```
New-IAMGroup -GroupName Developers
```

Output:

```
Arn        : arn:aws:iam::123456789012:group/Developers
CreateDate : 4/14/2015 11:21:31 AM
GroupId    : QNEJ5PM4NFSQCEXAMPLE1
GroupName  : Developers
Path       : /
```

- For API details, see CreateGroup in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a new IAM group named `Developers`.

```
New-IAMGroup -GroupName Developers
```

Output:

```
Arn        : arn:aws:iam::123456789012:group/Developers
CreateDate : 4/14/2015 11:21:31 AM
```

```
GroupId    : QNEJ5PM4NFSQCEXAMPLE1
GroupName  : Developers
Path       : /
```

- For API details, see CreateGroup in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

                });
            profileArn = profileGetResponse.InstanceProfile.Arn;
        }
        return profileArn;
    }
```

- For API details, see CreateInstanceProfile in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To create an instance profile

The following `create-instance-profile` command creates an instance profile named `Webserver`.

```
aws iam create-instance-profile \
    --instance-profile-name Webserver
```

Output:

```
{
    "InstanceProfile": {
        "InstanceProfileId": "AIPAJMBYC7DLSPEXAMPLE",
        "Roles": [],
        "CreateDate": "2015-03-09T20:33:19.626Z",
        "InstanceProfileName": "Webserver",
        "Path": "/",
        "Arn": "arn:aws:iam::123456789012:instance-profile/Webserver"
    }
}
```

To add a role to an instance profile, use the `add-role-to-instance-profile` command.

For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the *AWS IAM User Guide*.

- For API details, see CreateInstanceProfile in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
  const { InstanceProfile } = await iamClient.send(
    new CreateInstanceProfileCommand({
      InstanceProfileName: NAMES.ssmOnlyInstanceProfileName,
    }),
  );
  await waitUntilInstanceProfileExists(
    { client: iamClient },
    { InstanceProfileName: NAMES.ssmOnlyInstanceProfileName },
  );
```

- For API details, see CreateInstanceProfile in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a new IAM instance profile named `ProfileForDevEC2Instance`. You must separately run the `Add-IAMRoleToInstanceProfile` command to associate the instance profile with an existing IAM role that provides permissions to the instance. Finally, attach the instance profile to an EC2 instance when you launch it. To do that, use the `New-EC2Instance` cmdlet with either the `InstanceProfile_Arn` or `InstanceProfile_Name` parameter.

```
New-IAMInstanceProfile -InstanceProfileName ProfileForDevEC2Instance
```

Output:

```
Arn                 : arn:aws:iam::123456789012:instance-profile/
ProfileForDevEC2Instance
CreateDate          : 4/14/2015 11:31:39 AM
InstanceProfileId   : DYMFXL556EY46EXAMPLE1
InstanceProfileName : ProfileForDevEC2Instance
Path                : /
Roles               : {}
```

- For API details, see CreateInstanceProfile in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a new IAM instance profile named `ProfileForDevEC2Instance`. You must separately run the `Add-IAMRoleToInstanceProfile` command to associate the instance profile with an existing IAM role that provides permissions to the instance. Finally, attach the instance profile to an EC2 instance when you launch it. To do that, use the `New-EC2Instance` cmdlet with either the `InstanceProfile_Arn` or `InstanceProfile_Name` parameter.

```
New-IAMInstanceProfile -InstanceProfileName ProfileForDevEC2Instance
```

Output:

```
Arn                 : arn:aws:iam::123456789012:instance-profile/
ProfileForDevEC2Instance
CreateDate          : 4/14/2015 11:31:39 AM
InstanceProfileId   : DYMFXL556EY46EXAMPLE1
InstanceProfileName : ProfileForDevEC2Instance
Path                : /
Roles               : {}
```

- For API details, see CreateInstanceProfile in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

This example creates a policy, role, and instance profile and links them all together.

```
class AutoScalingWrapper:
    """
    Encapsulates Amazon EC2 Auto Scaling and EC2 management actions.
    """
```

```
    def __init__(
        self,
        resource_prefix: str,
        inst_type: str,

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `CreateLoginProfile` with a CLI

The following code examples show how to use `CreateLoginProfile`.

CLI

AWS CLI

To create a password for an IAM user

To create a password for an IAM user, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains the password. Using this method, you can create a strong password with non-alphanumeric characters. It can be difficult to create a password with non-alphanumeric characters when you pass it as a command line parameter.

To use the `--cli-input-json` parameter, start by using the `create-login-profile` command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam create-login-profile \
    --generate-cli-skeleton > create-login-profile.json
```

The previous command creates a JSON file called create-login-profile.json that you can use to fill in the information for a subsequent `create-login-profile` command. For example:

```
{
    "UserName": "Bob",
    "Password": "&1-3a6u:RA0djs",
    "PasswordResetRequired": true
}
```

Next, to create a password for an IAM user, use the `create-login-profile` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `create-login-profile` command uses the `--cli-input-json` parameter with a JSON file called create-login-profile.json.

```
aws iam create-login-profile \
    --cli-input-json file://create-login-profile.json
```

Output:

```
{
    "LoginProfile": {
        "UserName": "Bob",
```

```
        "CreateDate": "2015-03-10T20:55:40.274Z",
        "PasswordResetRequired": true
    }
}
```

If the new password violates the account password policy, the command returns a `PasswordPolicyViolation` error.

To change the password for a user that already has one, use `update-login-profile`. To set a password policy for the account, use the `update-account-password-policy` command.

If the account password policy allows them to, IAM users can change their own passwords using the `change-password` command.

For more information, see Managing passwords for IAM users in the *AWS IAM User Guide*.

- For API details, see CreateLoginProfile in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a (temporary) password for the IAM user named Bob, and sets the flag that requires the user to change the password the next time Bob signs in.

```
New-IAMLoginProfile -UserName Bob -Password P@ssw0rd -PasswordResetRequired $true
```

Output:

```
CreateDate                PasswordResetRequired             UserName
----------                ---------------------             --------
4/14/2015 12:26:30 PM     True                              Bob
```

- For API details, see CreateLoginProfile in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a (temporary) password for the IAM user named Bob, and sets the flag that requires the user to change the password the next time Bob signs in.

```
New-IAMLoginProfile -UserName Bob -Password P@ssw0rd -PasswordResetRequired $true
```

Output:

```
CreateDate                 PasswordResetRequired             UserName
----------                 ---------------------             --------
4/14/2015 12:26:30 PM      True                              Bob
```

- For API details, see CreateLoginProfile in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `CreateOpenIdConnectProvider` with a CLI

The following code examples show how to use `CreateOpenIdConnectProvider`.

CLI

AWS CLI

To create an OpenID Connect (OIDC) provider

To create an OpenID Connect (OIDC) provider, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains the required parameters. When you create an OIDC provider, you must pass the URL of the provider, and the URL must begin with `https://`. It can be difficult to pass the URL as a command line parameter, because the colon (:) and forward slash (/) characters have special meaning in some command line environments. Using the `--cli-input-json` parameter gets around this limitation.

To use the `--cli-input-json` parameter, start by using the `create-open-id-connect-provider` command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam create-open-id-connect-provider \
    --generate-cli-skeleton > create-open-id-connect-provider.json
```

The previous command creates a JSON file called create-open-id-connect-provider.json that you can use to fill in the information for a subsequent `create-open-id-connect-provider` command. For example:

```
{
    "Url": "https://server.example.com",
    "ClientIDList": [
        "example-application-ID"
    ],
    "ThumbprintList": [
        "c3768084dfb3d2b68b7897bf5f565da8eEXAMPLE"
    ]
}
```

If your OIDC provider's discovery and JWKS endpoints use different certificates, include thumbprints for both endpoints in the `ThumbprintList`.

Next, to create the OpenID Connect (OIDC) provider, use the `create-open-id-connect-provider` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `create-open-id-connect-provider` command uses the `--cli-input-json` parameter with a JSON file called create-open-id-connect-provider.json.

```
aws iam create-open-id-connect-provider \
    --cli-input-json file://create-open-id-connect-provider.json
```

Output:

```
{
    "OpenIDConnectProviderArn": "arn:aws:iam::123456789012:oidc-provider/
server.example.com"
}
```

For more information about OIDC providers, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

For more information about obtaining thumbprints for an OIDC provider, see Obtaining the thumbprint for an OpenID Connect Identity Provider in the *AWS IAM User Guide*.

- For API details, see CreateOpenIdConnectProvider in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates an IAM OIDC provider associated with the OIDC compatible provider service found at the URL `https://example.oidcprovider.com` and the client ID `my-testapp-1`. The OIDC provider supplies the thumbprint. To authenticate the thumbprint, follow the steps at http://docs.aws.amazon.com/IAM/latest/UserGuide/identity-providers-oidc-obtain-thumbprint.html.

```
New-IAMOpenIDConnectProvider -Url https://example.oidcprovider.com -ClientIDList
 my-testapp-1 -ThumbprintList 990F419EXAMPLEECF12DDEDA5EXAMPLE52F20D9E
```

Output:

```
arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com
```

- For API details, see CreateOpenIdConnectProvider in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates an IAM OIDC provider associated with the OIDC compatible provider service found at the URL `https://example.oidcprovider.com` and the client ID `my-testapp-1`. The OIDC provider supplies the thumbprint. To authenticate the thumbprint, follow the steps at http://docs.aws.amazon.com/IAM/latest/UserGuide/identity-providers-oidc-obtain-thumbprint.html.

```
New-IAMOpenIDConnectProvider -Url https://example.oidcprovider.com -ClientIDList
 my-testapp-1 -ThumbprintList 990F419EXAMPLEECF12DDEDA5EXAMPLE52F20D9E
```

Output:

```
arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com
```

- For API details, see CreateOpenIdConnectProvider in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `CreatePolicy` with an AWS SDK or CLI

The following code examples show how to use `CreatePolicy`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Create read-only and read-write users
- Creating a managed monitoring workspace
- Getting started with managed streaming
- Getting started with workflow orchestration
- Manage policies
- Set up Attribute-Based Access Control
- Setting up systems management
- Work with the IAM Policy Builder API

CLI

AWS CLI

Example 1: To create a customer managed policy

The following command creates a customer managed policy named `my-policy`. The file `policy.json` is a JSON document in the current folder that grants read only access to the `shared` folder in an Amazon S3 bucket named `amzn-s3-demo-bucket`.

```
aws iam create-policy \
    --policy-name my-policy \
    --policy-document file://policy.json
```

Contents of policy.json:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:Get*",
                "s3:List*"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket/shared/*"
            ]
        }
    ]
}
```

Output:

```
{
    "Policy": {
        "PolicyName": "my-policy",
        "CreateDate": "2015-06-01T19:31:18.620Z",
        "AttachmentCount": 0,
        "IsAttachable": true,
        "PolicyId": "ZXR6A36LTYANPAI7NJ5UV",
        "DefaultVersionId": "v1",
        "Path": "/",
        "Arn": "arn:aws:iam::0123456789012:policy/my-policy",
        "UpdateDate": "2015-06-01T19:31:18.620Z"
    }
}
```

For more information on using files as input for string parameters, see Specify parameter values for the AWS CLI in the *AWS CLI User Guide*.

Example 2: To create a customer managed policy with a description

The following command creates a customer managed policy named `my-policy` with an immutable description.

The file `policy.json` is a JSON document in the current folder that grants access to all Put, List, and Get actions for an Amazon S3 bucket named `amzn-s3-demo-bucket`.

```
aws iam create-policy \
    --policy-name my-policy \
    --policy-document file://policy.json \
    --description "This policy grants access to all Put, Get, and List actions
 for amzn-s3-demo-bucket"
```

Contents of policy.json:

```
{
   "Version":"2012-10-17",
   "Statement": [
       {
           "Effect": "Allow",
           "Action": [
                "s3:ListBucket*",
                "s3:PutBucket*",
                "s3:GetBucket*"
```

```
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket"
            ]
        }
    ]
}
```

Output:

```
{
    "Policy": {
        "PolicyName": "my-policy",
        "PolicyId": "ANPAWGSUGIDPEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:policy/my-policy",
        "Path": "/",
        "DefaultVersionId": "v1",
        "AttachmentCount": 0,
        "PermissionsBoundaryUsageCount": 0,
        "IsAttachable": true,
        "CreateDate": "2023-05-24T22:38:47+00:00",
        "UpdateDate": "2023-05-24T22:38:47+00:00"
    }
}
```

For more information on Idenity-based Policies, see Identity-based policies and resource-based policies in the *AWS IAM User Guide*.

Example 3: To create a customer managed policy with tags

The following command creates a customer managed policy named `my-policy` with tags. This example uses the `--tags` parameter with the following JSON-formatted tags: `'{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'`. Alternatively, the `--tags` parameter can be used with tags in the shorthand format: `'Key=Department,Value=Accounting Key=Location,Value=Seattle'`.

The file `policy.json` is a JSON document in the current folder that grants access to all Put, List, and Get actions for an Amazon S3 bucket named `amzn-s3-demo-bucket`.

```
aws iam create-policy \
    --policy-name my-policy \
```

```
    --policy-document file://policy.json \
    --tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location",
 "Value": "Seattle"}'
```

Contents of policy.json:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:ListBucket*",
                "s3:PutBucket*",
                "s3:GetBucket*"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket"
            ]
        }
    ]
}
```

Output:

```
{
    "Policy": {
        "PolicyName": "my-policy",
        "PolicyId": "ANPAWGSUGIDPEXAMPLE",
        "Arn": "arn:aws:iam::12345678012:policy/my-policy",
        "Path": "/",
        "DefaultVersionId": "v1",
        "AttachmentCount": 0,
        "PermissionsBoundaryUsageCount": 0,
        "IsAttachable": true,
        "CreateDate": "2023-05-24T23:16:39+00:00",
        "UpdateDate": "2023-05-24T23:16:39+00:00",
        "Tags": [
            {
                "Key": "Department",
                "Value": "Accounting"
            },
                "Key": "Location",
```

```
                "Value": "Seattle"
            {
        ]
    }
}
```

For more information on Tagging policies, see Tagging customer managed policies in the *AWS IAM User Guide*.

Use `CreatePolicyVersion` with an AWS SDK or CLI

The following code examples show how to use `CreatePolicyVersion`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage policies

CLI

AWS CLI

To create a new version of a managed policy

This example creates a new v2 version of the IAM policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` and makes it the default version.

```
aws iam create-policy-version \
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --policy-document file://NewPolicyVersion.json \
    --set-as-default
```

Output:

```
{
    "PolicyVersion": {
        "CreateDate": "2015-06-16T18:56:03.721Z",
```

```
        "VersionId": "v2",
        "IsDefaultVersion": true
    }
}
```

For more information, see Versioning IAM policies in the *AWS IAM User Guide*.

- For API details, see CreatePolicyVersion in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a new "v2" version of the IAM policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` and makes it the default version. The `NewPolicyVersion.json` file provides the policy content. Note that you must use the `-Raw` switch parameter to successfully process the JSON policy file.

```
New-IAMPolicyVersion -PolicyArn arn:aws:iam::123456789012:policy/MyPolicy -
PolicyDocument (Get-content -Raw NewPolicyVersion.json) -SetAsDefault $true
```

Output:

```
CreateDate                          Document                 IsDefaultVersion
          VersionId
----------                          --------                 ----------------
          ---------
4/15/2015 10:54:54 AM                                        True
          v2
```

- For API details, see CreatePolicyVersion in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a new "v2" version of the IAM policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` and makes it the default version. The `NewPolicyVersion.json` file provides the policy content. Note that you must use the `-Raw` switch parameter to successfully process the JSON policy file.

```
New-IAMPolicyVersion -PolicyArn arn:aws:iam::123456789012:policy/MyPolicy -
PolicyDocument (Get-content -Raw NewPolicyVersion.json) -SetAsDefault $true
```

Output:

```
CreateDate                      Document                IsDefaultVersion
           VersionId
----------                      --------                ---------------
           ---------
4/15/2015 10:54:54 AM                                   True
           v2
```

- For API details, see CreatePolicyVersion in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Use `CreateRole` with an AWS SDK or CLI

The following code examples show how to use `CreateRole`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Configure container service connectivity
- Create a container task for the serverless launch type
- Create a rest API with function proxy integration
- Creating a container service for virtual machine instances
- Creating a managed monitoring workspace
- Creating a monitoring dashboard with function name as a variable
- Creating your first serverless function
- Get started with serverless data warehouses
- Getting started with configuration management
- Getting started with internet of things device protection
- Getting started with machine learning feature stores
- Getting started with managed kubernetes clusters
- Getting started with managed streaming
- Getting started with provisioned data warehouse clusters
- Getting started with workflow orchestration
- Manage roles
- Moving hardcoded secrets to secure secret storage

- Run CPU stress tests on virtual machine instances using fault injection
- Setting up systems management
- Using property variables in monitoring dashboards to monitor multiple serverless functions
- Work with Streams and Time-to-Live

.NET

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::createIamRole(
        const Aws::String &roleName,
        const Aws::String &policy,
        const Aws::Client::ClientConfiguration &clientConfig) {
    Aws::IAM::IAMClient client(clientConfig);
    Aws::IAM::Model::CreateRoleRequest request;

    request.SetRoleName(roleName);
    request.SetAssumeRolePolicyDocument(policy);

    Aws::IAM::Model::CreateRoleOutcome outcome = client.CreateRole(request);
    if (!outcome.IsSuccess()) {
        std::cerr << "Error creating role. " <<
                  outcome.GetError().GetMessage() << std::endl;
    }
    else {
        const Aws::IAM::Model::Role iamRole = outcome.GetResult().GetRole();
        std::cout << "Created role " << iamRole.GetRoleName() << "\n";
        std::cout << "ID: " << iamRole.GetRoleId() << "\n";
```

```
        std::cout << "ARN: " << iamRole.GetArn() << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see CreateRole in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

Example 1: To create an IAM role

The following `create-role` command creates a role named `Test-Role` and attaches a trust policy to it.

```
aws iam create-role \
    --role-name Test-Role \
    --assume-role-policy-document file://Test-Role-Trust-Policy.json
```

Output:

```
{
    "Role": {
        "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
        "RoleId": "AKIAIOSFODNN7EXAMPLE",
        "CreateDate": "2013-06-07T20:43:32.821Z",
        "RoleName": "Test-Role",
        "Path": "/",
        "Arn": "arn:aws:iam::123456789012:role/Test-Role"
    }
}
```

The trust policy is defined as a JSON document in the *Test-Role-Trust-Policy.json* file. (The file name and extension do not have significance.) The trust policy must specify a principal.

To attach a permissions policy to a role, use the `put-role-policy` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

Example 2: To create an IAM role with specified maximum session duration

The following `create-role` command creates a role named `Test-Role` and sets a maximum session duration of 7200 seconds (2 hours).

```
aws iam create-role \
    --role-name Test-Role \
    --assume-role-policy-document file://Test-Role-Trust-Policy.json \
    --max-session-duration 7200
```

Output:

```
{
    "Role": {
        "Path": "/",
        "RoleName": "Test-Role",
        "RoleId": "AKIAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:role/Test-Role",
        "CreateDate": "2023-05-24T23:50:25+00:00",
        "AssumeRolePolicyDocument": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Sid": "Statement1",
                    "Effect": "Allow",
                    "Principal": {
                        "AWS": "arn:aws:iam::12345678012:root"
                    },
                    "Action": "sts:AssumeRole"
                }
            ]
        }
    }
}
```

For more information, see Modifying a role maximum session duration (AWS API) in the *AWS IAM User Guide*.

Example 3: To create an IAM Role with tags

The following command creates an IAM Role `Test-Role` with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: `'{"Key":`

"Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'. Alternatively, the --tags flag can be used with tags in the shorthand format: 'Key=Department,Value=Accounting Key=Location,Value=Seattle'.

```
aws iam create-role \
    --role-name Test-Role \
    --assume-role-policy-document file://Test-Role-Trust-Policy.json \
    --tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location",
 "Value": "Seattle"}'
```

Output:

```
{
    "Role": {
        "Path": "/",
        "RoleName": "Test-Role",
        "RoleId": "AKIAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:role/Test-Role",
        "CreateDate": "2023-05-25T23:29:41+00:00",
        "AssumeRolePolicyDocument": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Sid": "Statement1",
                    "Effect": "Allow",
                    "Principal": {
                        "AWS": "arn:aws:iam::123456789012:root"
                    },
                    "Action": "sts:AssumeRole"
                }
            ]
        },
        "Tags": [
            {
                "Key": "Department",
                "Value": "Accounting"
            },
            {
                "Key": "Location",
                "Value": "Seattle"
            }
        ]
    }
```

```
}
```

For more information, see Tagging IAM roles in the *AWS IAM User Guide*.

- For API details, see CreateRole in *AWS CLI Command Reference*.

Create the role.

```
import { CreateRoleCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} roleName
 */
export const createRole = (roleName) => {
  const command = new CreateRoleCommand({
    AssumeRolePolicyDocument: JSON.stringify({
      Version: "2012-10-17",
      Statement: [
        {
          Effect: "Allow",
          Principal: {
            Service: "lambda.amazonaws.com",
          },
          Action: "sts:AssumeRole",
        },
      ],
    }),
    RoleName: roleName,
  });

  return client.send(command);
};
```

- For API details, see CreateRole in *AWS SDK for JavaScript API Reference*.

```
$uuid = uniqid();
$service = new IAMService();

$assumeRolePolicyDocument = "{
                \"Version\": \"2012-10-17\",
                \"Statement\": [{
                    \"Effect\": \"Allow\",
                    \"Principal\": {\"AWS\": \"{$user['Arn']}\"},
                    \"Action\": \"sts:AssumeRole\"
                }]
            }";
$assumeRoleRole = $service->createRole("iam_demo_role_$uuid",
 $assumeRolePolicyDocument);
echo "Created role: {$assumeRoleRole['RoleName']}\n";

    /**
     * @param string $roleName
     * @param string $rolePolicyDocument
     * @return array
     * @throws AwsException
     */
    public function createRole(string $roleName, string $rolePolicyDocument)
    {
        $result = $this->customWaiter(function () use ($roleName,
 $rolePolicyDocument) {
            return $this->iamClient->createRole([
                'AssumeRolePolicyDocument' => $rolePolicyDocument,
                'RoleName' => $roleName,
            ]);
        });
        return $result['Role'];
    }
```

- For API details, see CreateRole in *AWS SDK for PHP API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a new role named `MyNewRole` and attaches to it the policy found in the file `NewRoleTrustPolicy.json`. Note that you must use the `-Raw` switch parameter to successfully process the JSON policy file. The policy document displayed in the output is URL encoded. It is decoded in this example with the `UrlDecode` .NET method.

```
$results = New-IAMRole -AssumeRolePolicyDocument (Get-Content -raw
 NewRoleTrustPolicy.json) -RoleName MyNewRole
$results
```

Output:

```
Arn                       : arn:aws:iam::123456789012:role/MyNewRole
AssumeRolePolicyDocument : %7B%0D%0A%20%20%22Version%22%3A%20%222012-10-17%22%2C

Use `CreateSAMLProvider` with an AWS SDK or CLI

The following code examples show how to use `CreateSAMLProvider`.

CLI

AWS CLI

To create a SAML provider

This example creates a new SAML provider in IAM named `MySAMLProvider`. It is described by the SAML metadata document found in the file `SAMLMetaData.xml`.

```
aws iam create-saml-provider \
    --saml-metadata-document file://SAMLMetaData.xml \
    --name MySAMLProvider
```

Output:

```
{
    "SAMLProviderArn": "arn:aws:iam::123456789012:saml-provider/MySAMLProvider"
}
```

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see CreateSAMLProvider in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import { CreateSAMLProviderCommand, IAMClient } from "@aws-sdk/client-iam";
import { readFileSync } from "node:fs";
import * as path from "node:path";
import { dirnameFromMetaUrl } from "@aws-doc-sdk-examples/lib/utils/util-fs.js";

const client = new IAMClient({});

/**
 * This sample document was generated using Auth0.
 * For more information on generating this document,
 see https://docs.aws.amazon.com/IAM/latest/UserGuide/
id_roles_providers_create_saml.html#samlstep1.
 */
const sampleMetadataDocument = readFileSync(
  path.join(
    dirnameFromMetaUrl(import.meta.url),
    "../../../../resources/sample_files/sample_saml_metadata.xml",
  ),
);

/**
 *
 * @param {*} providerName
 * @returns
 */
export const createSAMLProvider = async (providerName) => {
  const command = new CreateSAMLProviderCommand({
    Name: providerName,
    SAMLMetadataDocument: sampleMetadataDocument.toString(),
  });

  const response = await client.send(command);
  console.log(response);
  return response;
};
```

- For API details, see CreateSAMLProvider in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a new SAML provider entity in IAM. It is named `MySAMLProvider` and is described by the SAML metadata document found in the file `SAMLMetaData.xml`, which was separately downloaded from the SAML service provider's web site.

```
New-IAMSAMLProvider -Name MySAMLProvider -SAMLMetadataDocument (Get-Content -Raw
 SAMLMetaData.xml)
```

Output:

```
arn:aws:iam::123456789012:saml-provider/MySAMLProvider
```

- For API details, see CreateSAMLProvider in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a new SAML provider entity in IAM. It is named `MySAMLProvider` and is described by the SAML metadata document found in the file `SAMLMetaData.xml`, which was separately downloaded from the SAML service provider's web site.

```
New-IAMSAMLProvider -Name MySAMLProvider -SAMLMetadataDocument (Get-Content -Raw
 SAMLMetaData.xml)
```

Output:

```
arn:aws:iam::123456789012:saml-provider/MySAMLProvider
```

- For API details, see CreateSAMLProvider in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `CreateServiceLinkedRole` with an AWS SDK or CLI

The following code examples show how to use `CreateServiceLinkedRole`.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Create an IAM service-linked role.
    /// </summary>
    /// <param name="serviceName">The name of the AWS Service.</param>
    /// <param name="description">A description of the IAM service-linked role.</
param>
    /// <returns>The IAM role that was created.</returns>
    public async Task<Role> CreateServiceLinkedRoleAsync(string serviceName,
 string description)
    {
        var request = new CreateServiceLinkedRoleRequest
        {
            AWSServiceName = serviceName,
            Description = description
        };

        var response = await _IAMService.CreateServiceLinkedRoleAsync(request);
        return response.Role;
    }
```

- For API details, see CreateServiceLinkedRole in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To create a service-linked role

The following `create-service-linked-role` example creates a service-linked role for the specified AWS service and attaches the specified description.

```
aws iam create-service-linked-role \
    --aws-service-name lex.amazonaws.com \
    --description "My service-linked role to support Lex"
```

Output:

```
{
    "Role": {
        "Path": "/aws-service-role/lex.amazonaws.com/",
        "RoleName": "AWSServiceRoleForLexBots",
        "RoleId": "AROA1234567890EXAMPLE",
        "Arn": "arn:aws:iam::1234567890:role/aws-service-role/lex.amazonaws.com/
AWSServiceRoleForLexBots",
        "CreateDate": "2019-04-17T20:34:14+00:00",
        "AssumeRolePolicyDocument": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Action": [
                        "sts:AssumeRole"

Create a service-linked role.

```
import {
  CreateServiceLinkedRoleCommand,
  GetRoleCommand,
  IAMClient,
} from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} serviceName
 */
export const createServiceLinkedRole = async (serviceName) => {
  const command = new CreateServiceLinkedRoleCommand({
    // For a list of AWS services that support service-linked roles,
```

```
    // see https://docs.aws.amazon.com/IAM/latest/UserGuide/reference_aws-
services-that-work-with-iam.html.
    //
    // For a list of AWS service endpoints, see https://docs.aws.amazon.com/
general/latest/gr/aws-service-information.html.
    AWSServiceName: serviceName,
  });
  try {
    const response = await client.send(command);
    console.log(response);
    return response;
  } catch (caught) {
    if (
      caught instanceof Error &&
      caught.name === "InvalidInputException" &&
      caught.message.includes(
        "Service role name AWSServiceRoleForElasticBeanstalk has been taken in
 this account",
      )
    ) {
      console.warn(caught.message);
      return client.send(
        new GetRoleCommand({ RoleName: "AWSServiceRoleForElasticBeanstalk" }),
      );
    }
    throw caught;
  }
};
```

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    Aws::IAM::IAMClient iam(clientConfig);

    Aws::IAM::Model::CreateUserRequest create_request;
    create_request.SetUserName(userName);

    auto create_outcome = iam.CreateUser(create_request);
    if (!create_outcome.IsSuccess()) {
        std::cerr << "Error creating IAM user " << userName << ":" <<
                  create_outcome.GetError().GetMessage() << std::endl;
    }
    else {
        std::cout << "Successfully created IAM user " << userName << std::endl;
    }

    return create_outcome.IsSuccess();
```

- For API details, see CreateUser in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

Example 1: To create an IAM user

The following `create-user` command creates an IAM user named Bob in the current account.

```
aws iam create-user \
    --user-name Bob
```

Output:

```
{
    "User": {
        "UserName": "Bob",
        "Path": "/",
        "CreateDate": "2023-06-08T03:20:41.270Z",
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:user/Bob"
    }
}
```

For more information, see Creating an IAM user in your AWS account in the *AWS IAM User Guide*.

Example 2: To create an IAM user at a specified path

The following `create-user` command creates an IAM user named Bob at the specified path.

```
aws iam create-user \
    --user-name Bob \
    --path /division_abc/subdivision_xyz/
```

Output:

```
{
    "User": {
        "Path": "/division_abc/subdivision_xyz/",
        "UserName": "Bob",
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:user/division_abc/subdivision_xyz/Bob",
        "CreateDate": "2023-05-24T18:20:17+00:00"
    }
}
```

For more information, see IAM identifiers in the *AWS IAM User Guide*.

Example 3: To Create an IAM User with tags

The following `create-user` command creates an IAM user named Bob with tags. This example uses the `--tags` parameter flag with the following JSON-formatted

tags: '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'. Alternatively, the --tags flag can be used with tags in the shorthand format: 'Key=Department,Value=Accounting Key=Location,Value=Seattle'.

```
aws iam create-user \
    --user-name Bob \
    --tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location",
 "Value": "Seattle"}'
```

Output:

```
{
    "User": {
        "Path": "/",
        "UserName": "Bob",
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:user/Bob",
        "CreateDate": "2023-05-25T17:14:21+00:00",
        "Tags": [
            {
                "Key": "Department",
                "Value": "Accounting"
            },
            {
                "Key": "Location",
                "Value": "Seattle"
            }
        ]
    }
}
```

For more information, see Tagging IAM users in the *AWS IAM User Guide*.

Example 3: To create an IAM user with a set permissions boundary

The following create-user command creates an IAM user named Bob with the permissions boundary of AmazonS3FullAccess.

```
aws iam create-user \
    --user-name Bob \
    --permissions-boundary arn:aws:iam::aws:policy/AmazonS3FullAccess
```

Output:

```
{
    "User": {
        "Path": "/",
        "UserName": "Bob",
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:user/Bob",
        "CreateDate": "2023-05-24T17:50:53+00:00",
        "PermissionsBoundary": {
        "PermissionsBoundaryType": "Policy",
        "PermissionsBoundaryArn": "arn:aws:iam::aws:policy/AmazonS3FullAccess"
        }
    }
}
```

For more information, see Permissions boundaries for IAM entities in the *AWS IAM User Guide*.

- For API details, see CreateUser in *AWS CLI Command Reference*.

Use `CreateVirtualMfaDevice` with a CLI

The following code examples show how to use `CreateVirtualMfaDevice`.

CLI

AWS CLI

To create a virtual MFA device

This example creates a new virtual MFA device called `BobsMFADevice`. It creates a file that contains bootstrap information called `QRCode.png` and places it in the `C:/` directory. The bootstrap method used in this example is `QRCodePNG`.

```
aws iam create-virtual-mfa-device \
    --virtual-mfa-device-name BobsMFADevice \
    --outfile C:/QRCode.png \
    --bootstrap-method QRCodePNG
```

Output:

```
{
    "VirtualMFADevice": {
        "SerialNumber": "arn:aws:iam::210987654321:mfa/BobsMFADevice"
}
```

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see CreateVirtualMfaDevice in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a new virtual MFA device. Lines 2 and 3 extract the `Base32StringSeed` value that the virtual MFA software program needs to create an

account (as an alternative to the QR code). After you configure the program with the value, get two sequential authentication codes from the program. Finally, use the last command to link the virtual MFA device to the IAM user Bob and synchronize the account with the two authentication codes.

```
$Device = New-IAMVirtualMFADevice -VirtualMFADeviceName BobsMFADevice
$SR = New-Object System.IO.StreamReader($Device.Base32StringSeed)
$base32stringseed = $SR.ReadToEnd()
$base32stringseed
CZWZMCQNW4DEXAMPLE3VOUGXJFZYSUW7EXAMPLECR4NJFD65GX2SLUDW2EXAMPLE
```

Output:

```
-- Pause here to enter base-32 string seed code into virtual MFA program to
 register account. --

Enable-IAMMFADevice -SerialNumber $Device.SerialNumber -UserName Bob -
AuthenticationCode1 123456 -AuthenticationCode2 789012
```

Example 2: This example creates a new virtual MFA device. Lines 2 and 3 extract the QRCodePNG value and write it to a file. This image can be scanned by the virtual MFA software program to create an account (as an alternative to manually entering the Base32StringSeed value). After you create the account in your virtual MFA program, get two sequential authentication codes and enter them in the last commands to link the virtual MFA device to the IAM user Bob and synchronize the account.

```
$Device = New-IAMVirtualMFADevice -VirtualMFADeviceName BobsMFADevice
$BR = New-Object System.IO.BinaryReader($Device.QRCodePNG)
$BR.ReadBytes($BR.BaseStream.Length) | Set-Content -Encoding Byte -Path
 QRCode.png
```

Output:

```
 -- Pause here to scan PNG with virtual MFA program to register account. --

Enable-IAMMFADevice -SerialNumber $Device.SerialNumber -UserName Bob -
AuthenticationCode1 123456 -AuthenticationCode2 789012
```

- For API details, see CreateVirtualMfaDevice in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a new virtual MFA device. Lines 2 and 3 extract the `Base32StringSeed` value that the virtual MFA software program needs to create an account (as an alternative to the QR code). After you configure the program with the value, get two sequential authentication codes from the program. Finally, use the last command to link the virtual MFA device to the IAM user Bob and synchronize the account with the two authentication codes.

```
$Device = New-IAMVirtualMFADevice -VirtualMFADeviceName BobsMFADevice
$SR = New-Object System.IO.StreamReader($Device.Base32StringSeed)
$base32stringseed = $SR.ReadToEnd()
$base32stringseed
CZWZMCQNW4DEXAMPLE3VOUGXJFZYSUW7EXAMPLECR4NJFD65GX2SLUDW2EXAMPLE
```

Output:

```
-- Pause here to enter base-32 string seed code into virtual MFA program to
 register account. --

Enable-IAMMFADevice -SerialNumber $Device.SerialNumber -UserName Bob -
AuthenticationCode1 123456 -AuthenticationCode2 789012
```

Example 2: This example creates a new virtual MFA device. Lines 2 and 3 extract the `QRCodePNG` value and write it to a file. This image can be scanned by the virtual MFA software program to create an account (as an alternative to manually entering the Base32StringSeed value). After you create the account in your virtual MFA program, get two sequential authentication codes and enter them in the last commands to link the virtual MFA device to the IAM user Bob and synchronize the account.

```
$Device = New-IAMVirtualMFADevice -VirtualMFADeviceName BobsMFADevice
$BR = New-Object System.IO.BinaryReader($Device.QRCodePNG)
$BR.ReadBytes($BR.BaseStream.Length) | Set-Content -Encoding Byte -Path
 QRCode.png
```

Output:

```
 -- Pause here to scan PNG with virtual MFA program to register account. --
```

```
Enable-IAMMFADevice -SerialNumber $Device.SerialNumber -UserName Bob -
AuthenticationCode1 123456 -AuthenticationCode2 789012
```

- For API details, see CreateVirtualMfaDevice in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeactivateMfaDevice` with a CLI

The following code examples show how to use `DeactivateMfaDevice`.

CLI

AWS CLI

To deactivate an MFA device

This command deactivates the virtual MFA device with the ARN `arn:aws:iam::210987654321:mfa/BobsMFADevice` that is associated with the user Bob.

```
aws iam deactivate-mfa-device \
    --user-name Bob \
    --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice
```

This command produces no output.

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see DeactivateMfaDevice in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command disables the hardware MFA device associated with the user Bob that has the serial number 123456789012.

```
Disable-IAMMFADevice -UserName "Bob" -SerialNumber "123456789012"
```

Example 2: This command disables the virtual MFA device associated with the user `David` that has the ARN `arn:aws:iam::210987654321:mfa/David`. Note that virtual MFA device is not deleted from the account. The virtual device is still present and appears in the output of the `Get-IAMVirtualMFADevice` command. Before you can create a new virtual MFA device for the same user, you must delete the old one by using the `Remove-IAMVirtualMFADevice` command.

```
Disable-IAMMFADevice -UserName "David" -SerialNumber
 "arn:aws:iam::210987654321:mfa/David"
```

- For API details, see DeactivateMfaDevice in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command disables the hardware MFA device associated with the user Bob that has the serial number 123456789012.

```
Disable-IAMMFADevice -UserName "Bob" -SerialNumber "123456789012"
```

Example 2: This command disables the virtual MFA device associated with the user `David` that has the ARN `arn:aws:iam::210987654321:mfa/David`. Note that virtual MFA device is not deleted from the account. The virtual device is still present and appears in the output of the `Get-IAMVirtualMFADevice` command. Before you can create a new virtual MFA device for the same user, you must delete the old one by using the `Remove-IAMVirtualMFADevice` command.

```
Disable-IAMMFADevice -UserName "David" -SerialNumber
 "arn:aws:iam::210987654321:mfa/David"
```

- For API details, see DeactivateMfaDevice in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteAccessKey` with an AWS SDK or CLI

The following code examples show how to use `DeleteAccessKey`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Create read-only and read-write users
- Manage access keys

.NET

    }

    return outcome.IsSuccess();
}
```

- For API details, see DeleteAccessKey in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To delete an access key for an IAM user

The following `delete-access-key` command deletes the specified access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam delete-access-key \
    --access-key-id AKIDPMS9RO4H3FEXAMPLE \
    --user-name Bob
```

This command produces no output.

To list the access keys defined for an IAM user, use the `list-access-keys` command.

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see DeleteAccessKey in *AWS CLI Command Reference*.

Delete the access key.

```
import { DeleteAccessKeyCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} userName
 * @param {string} accessKeyId
 */
export const deleteAccessKey = (userName, accessKeyId) => {
  const command = new DeleteAccessKeyCommand({
    AccessKeyId: accessKeyId,
    UserName: userName,
  });

  return client.send(command);
};
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see DeleteAccessKey in *AWS SDK for JavaScript API Reference*.

SDK for JavaScript (v2)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// Load the AWS SDK for Node.js
var AWS = require("aws-sdk");
// Set the region
AWS.config.update({ region: "REGION" });

// Create the IAM service object
var iam = new AWS.IAM({ apiVersion: "2010-05-08" });

var params = {
  AccessKeyId: "ACCESS_KEY_ID",
  UserName: "USER_NAME",
};

iam.deleteAccessKey(params, function (err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

Use `DeleteAccountAlias` with an AWS SDK or CLI

The following code examples show how to use `DeleteAccountAlias`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage your account

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::deleteAccountAlias(const Aws::String &accountAlias,
                                     const Aws::Client::ClientConfiguration
 &clientConfig) {
    Aws::IAM::IAMClient iam(clientConfig);

    Aws::IAM::Model::DeleteAccountAliasRequest request;
    request.SetAccountAlias(accountAlias);

    const auto outcome = iam.DeleteAccountAlias(request);
    if (!outcome.IsSuccess()) {
        std::cerr << "Error deleting account alias " << accountAlias << ": "
                  << outcome.GetError().GetMessage() << std::endl;
    }
    else {
        std::cout << "Successfully deleted account alias " << accountAlias <<
                  std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see DeleteAccountAlias in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To delete an account alias

The following `delete-account-alias` command removes the alias `mycompany` for the current account.

```
aws iam delete-account-alias \
    --account-alias mycompany
```

This command produces no output.

For more information, see Your AWS account ID and its alias in the *AWS IAM User Guide*.

- For API details, see DeleteAccountAlias in *AWS CLI Command Reference*.

Use `DeleteAccountPasswordPolicy` with a CLI

The following code examples show how to use `DeleteAccountPasswordPolicy`.

CLI

AWS CLI

To delete the current account password policy

The following `delete-account-password-policy` command removes the password policy for the current account.

```
aws iam delete-account-password-policy
```

This command produces no output.

For more information, see Setting an account password policy for IAM users in the *AWS IAM User Guide*.

- For API details, see DeleteAccountPasswordPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the password policy for the AWS account and resets all values to their original defaults. If a password policy does not currently exist, the following error message appears: The account policy with name PasswordPolicy cannot be found.

```
Remove-IAMAccountPasswordPolicy
```

- For API details, see DeleteAccountPasswordPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the password policy for the AWS account and resets all values to their original defaults. If a password policy does not currently exist, the following error message appears: The account policy with name PasswordPolicy cannot be found.

```
Remove-IAMAccountPasswordPolicy
```

- For API details, see DeleteAccountPasswordPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteGroup` with an AWS SDK or CLI

The following code examples show how to use `DeleteGroup`.

CLI

AWS CLI

To delete an IAM group

The following `delete-group` command deletes an IAM group named `MyTestGroup`.

```
aws iam delete-group \
    --group-name MyTestGroup
```

This command produces no output.

For more information, see Deleting an IAM user group in the *AWS IAM User Guide*.

- For API details, see DeleteGroup in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import { DeleteGroupCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} groupName
 */
export const deleteGroup = async (groupName) => {
  const command = new DeleteGroupCommand({
    GroupName: groupName,
  });

  const response = await client.send(command);
  console.log(response);
  return response;
};
```

- For API details, see DeleteGroup in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the IAM group named `MyTestGroup`. The first command removes any IAM users that are members of the group, and the second command deletes the IAM group. Both commands work without any prompts for confirmation.

```
(Get-IAMGroup -GroupName MyTestGroup).Users | Remove-IAMUserFromGroup -GroupName
 MyTestGroup -Force
Remove-IAMGroup -GroupName MyTestGroup -Force
```

- For API details, see DeleteGroup in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the IAM group named `MyTestGroup`. The first command removes any IAM users that are members of the group, and the second command deletes the IAM group. Both commands work without any prompts for confirmation.

```
(Get-IAMGroup -GroupName MyTestGroup).Users | Remove-IAMUserFromGroup -GroupName
 MyTestGroup -Force
Remove-IAMGroup -GroupName MyTestGroup -Force
```

- For API details, see DeleteGroup in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteGroupPolicy` with a CLI

The following code examples show how to use `DeleteGroupPolicy`.

CLI

AWS CLI

To delete a policy from an IAM group

The following `delete-group-policy` command deletes the policy named `ExamplePolicy` from the group named `Admins`.

```
aws iam delete-group-policy \
    --group-name Admins \
    --policy-name ExamplePolicy
```

This command produces no output.

To see the policies attached to a group, use the `list-group-policies` command.

For more information, see Managing IAM policies in the *AWS IAM User Guide*.

- For API details, see DeleteGroupPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example removes the inline policy named `TesterPolicy` from the IAM group `Testers`. The users in that group immediately lose the permissions defined in that policy.

```
Remove-IAMGroupPolicy -GroupName Testers -PolicyName TestPolicy
```

- For API details, see DeleteGroupPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example removes the inline policy named `TesterPolicy` from the IAM group `Testers`. The users in that group immediately lose the permissions defined in that policy.

```
Remove-IAMGroupPolicy -GroupName Testers -PolicyName TestPolicy
```

- For API details, see DeleteGroupPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteInstanceProfile` with an AWS SDK or CLI

The following code examples show how to use `DeleteInstanceProfile`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Build and manage a resilient service
- Getting started with managed streaming
- Run CPU stress tests on virtual machine instances using fault injection

            Console.WriteLine($"Instance profile {profileName} does not exist.");
        }
    }
```

- For API details, see DeleteInstanceProfile in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To delete an instance profile

The following `delete-instance-profile` command deletes the instance profile named `ExampleInstanceProfile`.

```
aws iam delete-instance-profile \
    --instance-profile-name ExampleInstanceProfile
```

This command produces no output.

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see DeleteInstanceProfile in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
const client = new IAMClient({});
await client.send(
  new DeleteInstanceProfileCommand({
    InstanceProfileName: NAMES.instanceProfileName,
  }),
);
```

- For API details, see DeleteInstanceProfile in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the EC2 instance profile named `MyAppInstanceProfile`. The first command detaches any roles from the instance profile, and then the second command deletes the instance profile.

```
(Get-IAMInstanceProfile -InstanceProfileName MyAppInstanceProfile).Roles |
 Remove-IAMRoleFromInstanceProfile -InstanceProfileName MyAppInstanceProfile
Remove-IAMInstanceProfile -InstanceProfileName MyAppInstanceProfile
```

- For API details, see DeleteInstanceProfile in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the EC2 instance profile named `MyAppInstanceProfile`. The first command detaches any roles from the instance profile, and then the second command deletes the instance profile.

```
(Get-IAMInstanceProfile -InstanceProfileName MyAppInstanceProfile).Roles |
 Remove-IAMRoleFromInstanceProfile -InstanceProfileName MyAppInstanceProfile
Remove-IAMInstanceProfile -InstanceProfileName MyAppInstanceProfile
```

- For API details, see DeleteInstanceProfile in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

```

- For API details, see DeleteInstanceProfile in *AWS SDK for Python (Boto3) API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteLoginProfile` with a CLI

The following code examples show how to use `DeleteLoginProfile`.

CLI

AWS CLI

To delete a password for an IAM user

The following `delete-login-profile` command deletes the password for the IAM user named Bob.

```
aws iam delete-login-profile \
    --user-name Bob
```

This command produces no output.

For more information, see Managing passwords for IAM users in the *AWS IAM User Guide*.

- For API details, see DeleteLoginProfile in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the login profile from the IAM user named Bob. This prevents the user from signing-in to the AWS console. It does not prevent the user from running any AWS CLI, PowerShell, or API calls using AWS access keys that might still be attached to the user account.

```
Remove-IAMLoginProfile -UserName Bob
```

- For API details, see DeleteLoginProfile in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the login profile from the IAM user named Bob. This prevents the user from signing-in to the AWS console. It does not prevent the user from running any AWS CLI, PowerShell, or API calls using AWS access keys that might still be attached to the user account.

```
Remove-IAMLoginProfile -UserName Bob
```

- For API details, see DeleteLoginProfile in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteOpenIdConnectProvider` with a CLI

The following code examples show how to use `DeleteOpenIdConnectProvider`.

CLI

AWS CLI

To delete an IAM OpenID Connect identity provider

This example deletes the IAM OIDC provider that connects to the provider `example.oidcprovider.com`.

```
aws iam delete-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com
```

This command produces no output.

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see DeleteOpenIdConnectProvider in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the IAM OIDC provider that connects to the provider `example.oidcprovider.com`. Ensure that you update or delete any roles that reference this provider in the `Principal` element of the role's trust policy.

```
Remove-IAMOpenIDConnectProvider -OpenIDConnectProviderArn
 arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com
```

- For API details, see DeleteOpenIdConnectProvider in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the IAM OIDC provider that connects to the provider `example.oidcprovider.com`. Ensure that you update or delete any roles that reference this provider in the `Principal` element of the role's trust policy.

```
Remove-IAMOpenIDConnectProvider -OpenIDConnectProviderArn
 arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com
```

- For API details, see DeleteOpenIdConnectProvider in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeletePolicy` with an AWS SDK or CLI

The following code examples show how to use `DeletePolicy`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Create read-only and read-write users
- Creating a managed monitoring workspace
- Getting started with managed streaming
- Getting started with workflow orchestration
- Manage policies
- Setting up systems management

        println("Successfully deleted $policyARNVal")
    }
}
```

- For API details, see DeletePolicy in *AWS SDK for Kotlin API reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`. Before you can delete the policy, you must first delete all versions except the default by running `Remove-IAMPolicyVersion`. You must also detach the policy from any IAM users, groups, or roles.

```
Remove-IAMPolicy -PolicyArn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Example 2: This example deletes a policy by first deleting all the non-default policy versions, detaching it from all attached IAM entities, and finally deleting the policy itself. The first line retrieves the policy object. The second line retrieves all the policy versions that are not flagged as the default version into a collection and then deletes each policy in the collection. The third line retrieves all of the IAM users, groups, and roles to which the policy is attached. Lines four through six detach the policy from each attached entity. The last line uses this command to remove the managed policy as well as the remaining default version. The example includes the `-Force` switch parameter on any line that needs it to suppress prompts for confirmation.

```
$pol = Get-IAMPolicy -PolicyArn arn:aws:iam::123456789012:policy/MySamplePolicy
Get-IAMPolicyVersions -PolicyArn $pol.Arn | where {-not $_.IsDefaultVersion} |
 Remove-IAMPolicyVersion -PolicyArn $pol.Arn -force
$attached = Get-IAMEntitiesForPolicy -PolicyArn $pol.Arn
```

```
$attached.PolicyGroups | Unregister-IAMGroupPolicy -PolicyArn $pol.arn
$attached.PolicyRoles | Unregister-IAMRolePolicy -PolicyArn $pol.arn
$attached.PolicyUsers | Unregister-IAMUserPolicy -PolicyArn $pol.arn
Remove-IAMPolicy $pol.Arn -Force
```

- For API details, see DeletePolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`. Before you can delete the policy, you must first delete all versions except the default by running `Remove-IAMPolicyVersion`. You must also detach the policy from any IAM users, groups, or roles.

```
Remove-IAMPolicy -PolicyArn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Example 2: This example deletes a policy by first deleting all the non-default policy versions, detaching it from all attached IAM entities, and finally deleting the policy itself. The first line retrieves the policy object. The second line retrieves all the policy versions that are not flagged as the default version into a collection and then deletes each policy in the collection. The third line retrieves all of the IAM users, groups, and roles to which the policy is attached. Lines four through six detach the policy from each attached entity. The last line uses this command to remove the managed policy as well as the remaining default version. The example includes the `-Force` switch parameter on any line that needs it to suppress prompts for confirmation.

```
$pol = Get-IAMPolicy -PolicyArn arn:aws:iam::123456789012:policy/MySamplePolicy
Get-IAMPolicyVersions -PolicyArn $pol.Arn | where {-not $_.IsDefaultVersion} |
 Remove-IAMPolicyVersion -PolicyArn $pol.Arn -force
$attached = Get-IAMEntitiesForPolicy -PolicyArn $pol.Arn
$attached.PolicyGroups | Unregister-IAMGroupPolicy -PolicyArn $pol.arn
$attached.PolicyRoles | Unregister-IAMRolePolicy -PolicyArn $pol.arn
$attached.PolicyUsers | Unregister-IAMUserPolicy -PolicyArn $pol.arn
Remove-IAMPolicy $pol.Arn -Force
```

- For API details, see DeletePolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Use `DeletePolicyVersion` with an AWS SDK or CLI

The following code examples show how to use `DeletePolicyVersion`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Manage policies
- Roll back a policy version

CLI

AWS CLI

To delete a version of a managed policy

This example deletes the version identified as v2 from the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam delete-policy-version \
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --version-id v2
```

This command produces no output.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see DeletePolicyVersion in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the version identified as v2 from the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
Remove-IAMPolicyVersion -PolicyArn arn:aws:iam::123456789012:policy/
MySamplePolicy -VersionID v2
```

Example 2: This example deletes a policy by first deleting all non-default policy versions and then deleting the policy itself. The first line retrieves the policy object. The second line retrieves all of the policy versions that are not flagged as the default into a collection and then uses this command to delete each policy in the collection. The last line removes the policy itself as well as the remaining default version. Note that to successfully delete a managed policy, you must also detach the policy from any users, groups, or roles by using the `Unregister-IAMUserPolicy`, `Unregister-`

IAMGroupPolicy, and Unregister-IAMRolePolicy commands. See the example for the Remove-IAMPolicy cmdlet.

```
$pol = Get-IAMPolicy -PolicyArn arn:aws:iam::123456789012:policy/MySamplePolicy
Get-IAMPolicyVersions -PolicyArn $pol.Arn | where {-not $_.IsDefaultVersion} |
 Remove-IAMPolicyVersion -PolicyArn $pol.Arn -force
Remove-IAMPolicy -PolicyArn $pol.Arn -force
```

- For API details, see DeletePolicyVersion in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the version identified as v2 from the policy whose ARN is arn:aws:iam::123456789012:policy/MySamplePolicy.

```
Remove-IAMPolicyVersion -PolicyArn arn:aws:iam::123456789012:policy/
MySamplePolicy -VersionID v2
```

Example 2: This example deletes a policy by first deleting all non-default policy versions and then deleting the policy itself. The first line retrieves the policy object. The second line retrieves all of the policy versions that are not flagged as the default into a collection and then uses this command to delete each policy in the collection. The last line removes the policy itself as well as the remaining default version. Note that to successfully delete a managed policy, you must also detach the policy from any users, groups, or roles by using the Unregister-IAMUserPolicy, Unregister-IAMGroupPolicy, and Unregister-IAMRolePolicy commands. See the example for the Remove-IAMPolicy cmdlet.

```
$pol = Get-IAMPolicy -PolicyArn arn:aws:iam::123456789012:policy/MySamplePolicy
Get-IAMPolicyVersions -PolicyArn $pol.Arn | where {-not $_.IsDefaultVersion} |
 Remove-IAMPolicyVersion -PolicyArn $pol.Arn -force
Remove-IAMPolicy -PolicyArn $pol.Arn -force
```

- For API details, see DeletePolicyVersion in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

SAP ABAP

  return 0
}
```

- For API details, see DeleteRole in *AWS CLI Command Reference*.

CLI

AWS CLI

To delete an IAM role

The following `delete-role` command removes the role named `Test-Role`.

```
aws iam delete-role \
    --role-name Test-Role
```

This command produces no output.

Before you can delete a role, you must remove the role from any instance profile (`remove-role-from-instance-profile`), detach any managed policies (`detach-role-policy`) and delete any inline policies that are attached to the role (`delete-role-policy`).

For more information, see Creating IAM roles and Using instance profiles in the *AWS IAM User Guide*.

- For API details, see DeleteRole in *AWS CLI Command Reference*.

Go

SDK for Go V2

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import (
 "context"
 "encoding/json"
 "log"

 "github.com/aws/aws-sdk-go-v2/aws"
 "github.com/aws/aws-sdk-go-v2/service/iam"
 "github.com/aws/aws-sdk-go-v2/service/iam/types"
)

// RoleWrapper encapsulates AWS Identity and Access Management (IAM) role actions
// used in the examples.
// It contains an IAM service client that is used to perform role actions.
type RoleWrapper struct {
 IamClient *iam.Client
}

// DeleteRole deletes a role. All attached policies must be detached before a
// role can be deleted.
func (wrapper RoleWrapper) DeleteRole(ctx context.Context, roleName string) error
 {
 _, err := wrapper.IamClient.DeleteRole(ctx, &iam.DeleteRoleInput{
  RoleName: aws.String(roleName),
 })
```

```
 if err != nil {
  log.Printf("Couldn't delete role %v. Here's why: %v\n", roleName, err)
 }
 return err
}
```

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Delete the role.

```
import { DeleteRoleCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} roleName
 */
export const deleteRole = (roleName) => {
  const command = new DeleteRoleCommand({ RoleName: roleName });
  return client.send(command);
};
```

- For API details, see DeleteRole in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the role named `MyNewRole` from the current IAM account. Before you can delete the role you must first use the `Unregister-IAMRolePolicy` command to detach any managed policies. Inline policies are deleted with the role.

```
Remove-IAMRole -RoleName MyNewRole
```

Example 2: This example detaches any managed policies from the role named `MyNewRole` and then deletes the role. The first line retrieves any managed policies attached to the role as a collection and then detaches each policy in the collection from the role. The second line deletes the role itself. Inline policies are deleted along with the role.

```
Get-IAMAttachedRolePolicyList -RoleName MyNewRole | Unregister-IAMRolePolicy -
RoleName MyNewRole
Remove-IAMRole -RoleName MyNewRole
```

- For API details, see DeleteRole in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the role named `MyNewRole` from the current IAM account. Before you can delete the role you must first use the `Unregister-IAMRolePolicy` command to detach any managed policies. Inline policies are deleted with the role.

```
Remove-IAMRole -RoleName MyNewRole
```

Example 2: This example detaches any managed policies from the role named `MyNewRole` and then deletes the role. The first line retrieves any managed policies attached to the role as a collection and then detaches each policy in the collection from the role. The second line deletes the role itself. Inline policies are deleted along with the role.

```
Get-IAMAttachedRolePolicyList -RoleName MyNewRole | Unregister-IAMRolePolicy -
RoleName MyNewRole
```

```
Remove-IAMRole -RoleName MyNewRole
```

- For API details, see DeleteRole in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

import AWSIAM
import AWSS3

    public func deleteRole(role: IAMClientTypes.Role) async throws {
        let input = DeleteRoleInput(
            roleName: role.roleName
        )
        do {
            _ = try await iamClient.deleteRole(input: input)
        } catch {
            print("ERROR: deleteRole:", dump(error))
            throw error
        }
    }
```

- For API details, see DeleteRole in *AWS SDK for Swift API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteRolePermissionsBoundary` with a CLI

The following code examples show how to use `DeleteRolePermissionsBoundary`.

CLI

AWS CLI

To delete a permissions boundary from an IAM role

The following `delete-role-permissions-boundary` example deletes the permissions boundary for the specified IAM role. To apply a permissions boundary to a role, use the `put-role-permissions-boundary` command.

```
aws iam delete-role-permissions-boundary \
    --role-name lambda-application-role
```

This command produces no output.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see DeleteRolePermissionsBoundary in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example shows how to remove the permission boundary attached to an IAM role.

```
Remove-IAMRolePermissionsBoundary -RoleName MyRoleName
```

- For API details, see DeleteRolePermissionsBoundary in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example shows how to remove the permission boundary attached to an IAM role.

```
Remove-IAMRolePermissionsBoundary -RoleName MyRoleName
```

- For API details, see DeleteRolePermissionsBoundary in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteRolePolicy` with an AWS SDK or CLI

The following code examples show how to use `DeleteRolePolicy`.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the inline policy `S3AccessPolicy` that is embedded in the IAM role `S3BackupRole`.

```
Remove-IAMRolePolicy -PolicyName S3AccessPolicy -RoleName S3BackupRole
```

- For API details, see DeleteRolePolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the inline policy `S3AccessPolicy` that is embedded in the IAM role `S3BackupRole`.

```
Remove-IAMRolePolicy -PolicyName S3AccessPolicy -RoleName S3BackupRole
```

- For API details, see DeleteRolePolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteSAMLProvider` with an AWS SDK or CLI

The following code examples show how to use `DeleteSAMLProvider`.

CLI

AWS CLI

To delete a SAML provider

This example deletes the IAM SAML 2.0 provider whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider`.

```
aws iam delete-saml-provider \
--saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider
```

This command produces no output.

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see DeleteSAMLProvider in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import { DeleteSAMLProviderCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} providerArn
 * @returns
 */
export const deleteSAMLProvider = async (providerArn) => {
  const command = new DeleteSAMLProviderCommand({
    SAMLProviderArn: providerArn,
  });

  const response = await client.send(command);
  console.log(response);
  return response;
};
```

- For API details, see DeleteSAMLProvider in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the IAM SAML 2.0 provider whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider`.

```
Remove-IAMSAMLProvider -SAMLProviderArn arn:aws:iam::123456789012:saml-provider/
SAMLADFSProvider
```

- For API details, see DeleteSAMLProvider in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the IAM SAML 2.0 provider whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider`.

```
Remove-IAMSAMLProvider -SAMLProviderArn arn:aws:iam::123456789012:saml-provider/
SAMLADFSProvider
```

- For API details, see DeleteSAMLProvider in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteServerCertificate` with an AWS SDK or CLI

The following code examples show how to use `DeleteServerCertificate`.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::deleteServerCertificate(const Aws::String &certificateName,
                                          const Aws::Client::ClientConfiguration
 &clientConfig) {
    Aws::IAM::IAMClient iam(clientConfig);
    Aws::IAM::Model::DeleteServerCertificateRequest request;
    request.SetServerCertificateName(certificateName);

    const auto outcome = iam.DeleteServerCertificate(request);
    bool result = true;
```

```
    if (!outcome.IsSuccess()) {
        if (outcome.GetError().GetErrorType() !=
 Aws::IAM::IAMErrors::NO_SUCH_ENTITY) {
            std::cerr << "Error deleting server certificate " << certificateName
 <<
                      ": " << outcome.GetError().GetMessage() << std::endl;
            result = false;
        }
        else {
            std::cout << "Certificate '" << certificateName
                      << "' not found." << std::endl;
        }
    }
    else {
        std::cout << "Successfully deleted server certificate " <<
 certificateName
                  << std::endl;
    }

    return result;
}
```

- For API details, see DeleteServerCertificate in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To delete a server certificate from your AWS account

The following `delete-server-certificate` command removes the specified server certificate from your AWS account.

```
aws iam delete-server-certificate \
    --server-certificate-name myUpdatedServerCertificate
```

This command produces no output.

To list the server certificates available in your AWS account, use the `list-server-certificates` command.

For more information, see Managing server certificates in IAM in the *AWS IAM User Guide*.

- For API details, see DeleteServerCertificate in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Delete a server certificate.

```
import { DeleteServerCertificateCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} certName
 */
export const deleteServerCertificate = (certName) => {
  const command = new DeleteServerCertificateCommand({
    ServerCertificateName: certName,
  });

  return client.send(command);
};
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see DeleteServerCertificate in *AWS SDK for JavaScript API Reference*.

SDK for JavaScript (v2)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// Load the AWS SDK for Node.js
var AWS = require("aws-sdk");
// Set the region
AWS.config.update({ region: "REGION" });

// Create the IAM service object
var iam = new AWS.IAM({ apiVersion: "2010-05-08" });

iam.deleteServerCertificate(
  { ServerCertificateName: "CERTIFICATE_NAME" },
  function (err, data) {
    if (err) {
      console.log("Error", err);
    } else {
      console.log("Success", data);
    }
  }
);
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see DeleteServerCertificate in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the server certificate named `MyServerCert`.

```
Remove-IAMServerCertificate -ServerCertificateName MyServerCert
```

- For API details, see DeleteServerCertificate in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the server certificate named `MyServerCert`.

```
Remove-IAMServerCertificate -ServerCertificateName MyServerCert
```

- For API details, see DeleteServerCertificate in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Ruby

SDK for Ruby

> **Note**

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteServiceLinkedRole` with an AWS SDK or CLI

The following code examples show how to use `DeleteServiceLinkedRole`.

CLI

AWS CLI

To delete a service-linked role

The following `delete-service-linked-role` example deletes the specified service-linked role that you no longer need. The deletion happens asynchronously. You can check the status of the deletion and confirm when it is done by using the `get-service-linked-role-deletion-status` command.

```
aws iam delete-service-linked-role \
    --role-name AWSServiceRoleForLexBots
```

Output:

```
{
    "DeletionTaskId": "task/aws-service-role/lex.amazonaws.com/
AWSServiceRoleForLexBots/1a2b3c4d-1234-abcd-7890-abcdeEXAMPLE"
}
```

For more information, see Using service-linked roles in the *AWS IAM User Guide*.

- For API details, see DeleteServiceLinkedRole in *AWS CLI Command Reference*.

Go

Use `DeleteSigningCertificate` with a CLI

The following code examples show how to use `DeleteSigningCertificate`.

CLI

AWS CLI

To delete a signing certificate for an IAM user

The following `delete-signing-certificate` command deletes the specified signing certificate for the IAM user named Bob.

```
aws iam delete-signing-certificate \
    --user-name Bob \
    --certificate-id TA7SMP42TDN5Z26OBPJE7EXAMPLE
```

This command produces no output.

To get the ID for a signing certificate, use the `list-signing-certificates` command.

For more information, see Manage signing certificates in the *Amazon EC2 User Guide*.

- For API details, see DeleteSigningCertificate in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the signing certificate with the ID Y3EK7RMEXAMPLESV33FCREXAMPLEMJLU from the IAM user named Bob.

```
Remove-IAMSigningCertificate -UserName Bob -CertificateId
 Y3EK7RMEXAMPLESV33FCREXAMPLEMJLU
```

- For API details, see DeleteSigningCertificate in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the signing certificate with the ID Y3EK7RMEXAMPLESV33FCREXAMPLEMJLU from the IAM user named Bob.

```
Remove-IAMSigningCertificate -UserName Bob -CertificateId
 Y3EK7RMEXAMPLESV33FCREXAMPLEMJLU
```

- For API details, see DeleteSigningCertificate in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteUser` with an AWS SDK or CLI

The following code examples show how to use `DeleteUser`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Create read-only and read-write users

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Delete the user.

```
import { DeleteUserCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} name
 */
export const deleteUser = (name) => {
  const command = new DeleteUserCommand({ UserName: name });
  return client.send(command);
};
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see DeleteUser in *AWS SDK for JavaScript API Reference*.

SDK for JavaScript (v2)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// Load the AWS SDK for Node.js
var AWS = require("aws-sdk");
// Set the region
```

```
AWS.config.update({ region: "REGION" });

// Create the IAM service object
var iam = new AWS.IAM({ apiVersion: "2010-05-08" });

var params = {
  UserName: process.argv[2],
};

iam.getUser(params, function (err, data) {
  if (err && err.code === "NoSuchEntity") {
    console.log("User " + process.argv[2] + " does not exist.");
  } else {
    iam.deleteUser(params, function (err, data) {
      if (err) {
        console.log("Error", err);
      } else {
        console.log("Success", data);
      }
    });
  }
});
```

Kotlin

SDK for Kotlin

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
suspend fun deleteIAMUser(userNameVal: String) {
    val request =
        DeleteUserRequest {
            userName = userNameVal
```

```
        }

    // To delete a user, ensure that the user's access keys are deleted first.
    IamClient.fromEnvironment { region = "AWS_GLOBAL" }.use { iamClient ->
        iamClient.deleteUser(request)
        println("Successfully deleted user $userNameVal")
    }
}
```

- For API details, see DeleteUser in *AWS SDK for Kotlin API reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the IAM user named Bob.

```
Remove-IAMUser -UserName Bob
```

Example 2: This example deletes the IAM user named Theresa along with any elements that must be deleted first.

```
$name = "Theresa"

# find any groups and remove user from them
$groups = Get-IAMGroupForUser -UserName $name
foreach ($group in $groups) { Remove-IAMUserFromGroup -GroupName $group.GroupName
 -UserName $name -Force }

# find any inline policies and delete them
$inlinepols = Get-IAMUserPolicies -UserName $name
foreach ($pol in $inlinepols) { Remove-IAMUserPolicy -PolicyName $pol -UserName
 $name -Force}

# find any managed polices and detach them
$managedpols = Get-IAMAttachedUserPolicies -UserName $name
foreach ($pol in $managedpols) { Unregister-IAMUserPolicy -PolicyArn
 $pol.PolicyArn -UserName $name }

# find any signing certificates and delete them
$certs = Get-IAMSigningCertificate -UserName $name
```

```
foreach ($cert in $certs) { Remove-IAMSigningCertificate -CertificateId
 $cert.CertificateId -UserName $name -Force }

# find any access keys and delete them
$keys = Get-IAMAccessKey -UserName $name
foreach ($key in $keys) { Remove-IAMAccessKey -AccessKeyId $key.AccessKeyId -
UserName $name -Force }

# delete the user's login profile, if one exists - note: need to use try/catch to
 suppress not found error
try { $prof = Get-IAMLoginProfile -UserName $name -ea 0 } catch { out-null }
if ($prof) { Remove-IAMLoginProfile -UserName $name -Force }

# find any MFA device, detach it, and if virtual, delete it.
$mfa = Get-IAMMFADevice -UserName $name

Swift

SDK for Swift

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import AWSIAM
import AWSS3

    public func deleteUser(user: IAMClientTypes.User) async throws {
        let input = DeleteUserInput(
            userName: user.userName
        )
        do {
            _ = try await iamClient.deleteUser(input: input)
        } catch {
            print("ERROR: deleteUser:", dump(error))
            throw error
        }
    }
```

- For API details, see DeleteUser in *AWS SDK for Swift API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteUserPermissionsBoundary` with a CLI

The following code examples show how to use `DeleteUserPermissionsBoundary`.

CLI

AWS CLI

To delete a permissions boundary from an IAM user

The following `delete-user-permissions-boundary` example deletes the permissions boundary attached to the IAM user named `intern`. To apply a permissions boundary to a user, use the `put-user-permissions-boundary` command.

```
aws iam delete-user-permissions-boundary \
    --user-name intern
```

This command produces no output.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see DeleteUserPermissionsBoundary in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example shows how to remove the permission boundary attached to an IAM user.

```
Remove-IAMUserPermissionsBoundary -UserName joe
```

- For API details, see DeleteUserPermissionsBoundary in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example shows how to remove the permission boundary attached to an IAM user.

```
Remove-IAMUserPermissionsBoundary -UserName joe
```

- For API details, see DeleteUserPermissionsBoundary in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteUserPolicy` with an AWS SDK or CLI

The following code examples show how to use `DeleteUserPolicy`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   /// <summary>
   /// Delete an IAM user policy.
   /// </summary>
   /// <param name="policyName">The name of the IAM policy to delete.</param>
   /// <param name="userName">The username of the IAM user.</param>
   /// <returns>A Boolean value indicating the success of the action.</returns>
   public async Task<bool> DeleteUserPolicyAsync(string policyName, string
userName)
   {
       var response = await _IAMService.DeleteUserPolicyAsync(new
DeleteUserPolicyRequest { PolicyName = policyName, UserName = userName });

       return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
   }
```

- For API details, see DeleteUserPolicy in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To remove a policy from an IAM user

The following `delete-user-policy` command removes the specified policy from the IAM user named Bob.

```
aws iam delete-user-policy \
    --user-name Bob \
    --policy-name ExamplePolicy
```

This command produces no output.

To get a list of policies for an IAM user, use the `list-user-policies` command.

For more information, see Creating an IAM user in your AWS account in the *AWS IAM User Guide*.

- For API details, see DeleteUserPolicy in *AWS CLI Command Reference*.

Go

SDK for Go V2

> **Note**
>

)

// UserWrapper encapsulates user actions used in the examples.
// It contains an IAM service client that is used to perform user actions.
type UserWrapper struct {
 IamClient *iam.Client
}

// DeleteUserPolicy deletes an inline policy from a user.
func (wrapper UserWrapper) DeleteUserPolicy(ctx context.Context, userName string,
 policyName string) error {
 _, err := wrapper.IamClient.DeleteUserPolicy(ctx, &iam.DeleteUserPolicyInput{
  PolicyName: aws.String(policyName),
  UserName:   aws.String(userName),
 })
 if err != nil {
  log.Printf("Couldn't delete policy from user %v. Here's why: %v\n", userName,
 err)
 }
 return err
}
```

- For API details, see DeleteUserPolicy in *AWS SDK for Go API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the inline policy named `AccessToEC2Policy` that is embedded in the IAM user named `Bob`.

```
Remove-IAMUserPolicy -PolicyName AccessToEC2Policy -UserName Bob
```

Example 2: This example finds all of the inline polices that are embedded in the IAM user named `Theresa` and then deletes them.

```
$inlinepols = Get-IAMUserPolicies -UserName Theresa
foreach ($pol in $inlinepols) { Remove-IAMUserPolicy -PolicyName $pol -UserName
 Theresa -Force}
```

- For API details, see DeleteUserPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the inline policy named `AccessToEC2Policy` that is embedded in the IAM user named Bob.

```
Remove-IAMUserPolicy -PolicyName AccessToEC2Policy -UserName Bob
```

Example 2: This example finds all of the inline polices that are embedded in the IAM user named `Theresa` and then deletes them.

```
$inlinepols = Get-IAMUserPolicies -UserName Theresa
foreach ($pol in $inlinepols) { Remove-IAMUserPolicy -PolicyName $pol -UserName
 Theresa -Force}
```

- For API details, see DeleteUserPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

    end

    @iam_client.delete_user(user_name: user_name)
    @logger.info("Deleted user '#{user_name}'.")
  rescue Aws::IAM::Errors::ServiceError => e
    @logger.error("Error deleting user '#{user_name}': #{e.message}")
  end
```

- For API details, see DeleteUserPolicy in *AWS SDK for Ruby API Reference*.

Rust

SDK for Rust

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
pub async fn delete_user_policy(
    client: &iamClient,
    user: &User,
    policy_name: &str,
) -> Result<(), SdkError<DeleteUserPolicyError>> {
    client
        .delete_user_policy()
        .user_name(user.user_name())
        .policy_name(policy_name)
        .send()
        .await?;

    Ok(())
}
```

- For API details, see DeleteUserPolicy in *AWS SDK for Rust API reference*.

Swift

SDK for Swift

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import AWSIAM
import AWSS3

    func deleteUserPolicy(user: IAMClientTypes.User, policyName: String) async
 throws {
        let input = DeleteUserPolicyInput(
            policyName: policyName,
            userName: user.userName
        )
        do {
            _ = try await iamClient.deleteUserPolicy(input: input)
        } catch {
            print("ERROR: deleteUserPolicy:", dump(error))
            throw error
        }
    }
```

- For API details, see DeleteUserPolicy in *AWS SDK for Swift API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteVirtualMfaDevice` with a CLI

The following code examples show how to use `DeleteVirtualMfaDevice`.

CLI

AWS CLI

To remove a virtual MFA device

The following `delete-virtual-mfa-device` command removes the specified MFA device from the current account.

```
aws iam delete-virtual-mfa-device \
    --serial-number arn:aws:iam::123456789012:mfa/MFATest
```

This command produces no output.

For more information, see Deactivating MFA devices in the *AWS IAM User Guide*.

- For API details, see DeleteVirtualMfaDevice in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the IAM virtual MFA device whose ARN is `arn:aws:iam::123456789012:mfa/bob`.

```
Remove-IAMVirtualMFADevice -SerialNumber arn:aws:iam::123456789012:mfa/bob
```

Example 2: This example checks to see whether the IAM user Theresa has an MFA device assigned. If one is found, the device is disabled for the IAM user. If the device is virtual, then it is also deleted.

```
$mfa = Get-IAMMFADevice -UserName Theresa
if ($mfa) {
    Disable-IAMMFADevice -SerialNumber $mfa.SerialNumber -UserName $name
    if ($mfa.SerialNumber -like "arn:*") { Remove-IAMVirtualMFADevice -
SerialNumber $mfa.SerialNumber }
}
```

- For API details, see DeleteVirtualMfaDevice in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the IAM virtual MFA device whose ARN is `arn:aws:iam::123456789012:mfa/bob`.

```
Remove-IAMVirtualMFADevice -SerialNumber arn:aws:iam::123456789012:mfa/bob
```

Example 2: This example checks to see whether the IAM user Theresa has an MFA device assigned. If one is found, the device is disabled for the IAM user. If the device is virtual, then it is also deleted.

```
$mfa = Get-IAMMFADevice -UserName Theresa
if ($mfa) {
    Disable-IAMMFADevice -SerialNumber $mfa.SerialNumber -UserName $name
    if ($mfa.SerialNumber -like "arn:*") { Remove-IAMVirtualMFADevice -
SerialNumber $mfa.SerialNumber }
}
```

- For API details, see DeleteVirtualMfaDevice in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DetachGroupPolicy` with a CLI

The following code examples show how to use `DetachGroupPolicy`.

CLI

AWS CLI

To detach a policy from a group

This example removes the managed policy with the ARN `arn:aws:iam::123456789012:policy/TesterAccessPolicy` from the group called `Testers`.

```
aws iam detach-group-policy \
```

```
    --group-name Testers \
    --policy-arn arn:aws:iam::123456789012:policy/TesterAccessPolicy
```

This command produces no output.

For more information, see Managing IAM user groups in the *AWS IAM User Guide*.

- For API details, see DetachGroupPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example detaches the managed group policy whose ARN is `arn:aws:iam::123456789012:policy/TesterAccessPolicy` from the group named `Testers`.

```
Unregister-IAMGroupPolicy -GroupName Testers -PolicyArn
 arn:aws:iam::123456789012:policy/TesterAccessPolicy
```

Example 2: This example finds all the managed policies that are attached to the group named `Testers` and detaches them from the group.

```
Get-IAMAttachedGroupPolicies -GroupName Testers | Unregister-IAMGroupPolicy -
Groupname Testers
```

- For API details, see DetachGroupPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example detaches the managed group policy whose ARN is `arn:aws:iam::123456789012:policy/TesterAccessPolicy` from the group named `Testers`.

```
Unregister-IAMGroupPolicy -GroupName Testers -PolicyArn
 arn:aws:iam::123456789012:policy/TesterAccessPolicy
```

Example 2: This example finds all the managed policies that are attached to the group named `Testers` and detaches them from the group.

```
Get-IAMAttachedGroupPolicies -GroupName Testers | Unregister-IAMGroupPolicy -
Groupname Testers
```

- For API details, see DetachGroupPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DetachRolePolicy` with an AWS SDK or CLI

The following code examples show how to use `DetachRolePolicy`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Configure container service connectivity
- Create a rest API with function proxy integration
- Creating a managed monitoring workspace
- Creating a monitoring dashboard with function name as a variable
- Creating your first serverless function

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    Aws::IAM::IAMClient iam(clientConfig);

    Aws::IAM::Model::DetachRolePolicyRequest detachRequest;
    detachRequest.SetRoleName(roleName);
    detachRequest.SetPolicyArn(policyArn);

    auto detachOutcome = iam.DetachRolePolicy(detachRequest);
    if (!detachOutcome.IsSuccess()) {
        std::cerr << "Failed to detach policy " << policyArn << " from role "
                  << roleName << ": " << detachOutcome.GetError().GetMessage() <<
                  std::endl;
    }
    else {
        std::cout << "Successfully detached policy " << policyArn << " from role
 "
                  << roleName << std::endl;
    }

    return detachOutcome.IsSuccess();
```

- For API details, see DetachRolePolicy in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To detach a policy from a role

This example removes the managed policy with the ARN `arn:aws:iam::123456789012:policy/FederatedTesterAccessPolicy` from the role called `FedTesterRole`.

```
aws iam detach-role-policy \
    --role-name FedTesterRole \
    --policy-arn arn:aws:iam::123456789012:policy/FederatedTesterAccessPolicy
```

This command produces no output.

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see DetachRolePolicy in *AWS CLI Command Reference*.

Use `DetachUserPolicy` with an AWS SDK or CLI

The following code examples show how to use `DetachUserPolicy`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Create read-only and read-write users

CLI

AWS CLI

To detach a policy from a user

This example removes the managed policy with the ARN `arn:aws:iam::123456789012:policy/TesterPolicy` from the user Bob.

```
aws iam detach-user-policy \
    --user-name Bob \
    --policy-arn arn:aws:iam::123456789012:policy/TesterPolicy
```

This command produces no output.

For more information, see Changing permissions for an IAM user in the *AWS IAM User Guide*.

- For API details, see DetachUserPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example detaches the managed policy whose ARN is `arn:aws:iam::123456789012:policy/TesterPolicy` from the IAM user named Bob.

```
Unregister-IAMUserPolicy -UserName Bob -PolicyArn
 arn:aws:iam::123456789012:policy/TesterPolicy
```

Example 2: This example finds all the managed policies that are attached to the IAM user named Theresa and detaches those policies from the user.

```
Get-IAMAttachedUserPolicyList -UserName Theresa | Unregister-IAMUserPolicy -
Username Theresa
```

- For API details, see DetachUserPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example detaches the managed policy whose ARN is `arn:aws:iam::123456789012:policy/TesterPolicy` from the IAM user named Bob.

```
Unregister-IAMUserPolicy -UserName Bob -PolicyArn
 arn:aws:iam::123456789012:policy/TesterPolicy
```

Example 2: This example finds all the managed policies that are attached to the IAM user named Theresa and detaches those policies from the user.

```
Get-IAMAttachedUserPolicyList -UserName Theresa | Unregister-IAMUserPolicy -
Username Theresa
```

- For API details, see DetachUserPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Use `EnableMfaDevice` with a CLI

The following code examples show how to use `EnableMfaDevice`.

CLI

AWS CLI

To enable an MFA device

After you use the `create-virtual-mfa-device` command to create a new virtual MFA device, you can assign the MFA device to a user. The following `enable-mfa-device` example assigns the MFA device with the serial number `arn:aws:iam::210987654321:mfa/BobsMFADevice` to the user Bob. The command also synchronizes the device with AWS by including the first two codes in sequence from the virtual MFA device.

```
aws iam enable-mfa-device \
    --user-name Bob \
    --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice \
    --authentication-code1 123456 \
    --authentication-code2 789012
```

This command produces no output.

For more information, see Enabling a virtual multi-factor authentication (MFA) device in the *AWS IAM User Guide*.

- For API details, see EnableMfaDevice in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command enables the hardware MFA device with the serial number 987654321098 and associates the device with the user Bob. It includes the first two codes in sequence from the device.

```
Enable-IAMMFADevice -UserName "Bob" -SerialNumber "987654321098" -
AuthenticationCode1 "12345678" -AuthenticationCode2 "87654321"
```

Example 2: This example creates and enables a virtual MFA device. The first command creates the virtual device and returns the device's object representation in the variable `$MFADevice`. You can use the `.Base32StringSeed` or `QRCodePng` properties to configure the user's software application. The final command assigns the device to the user `David`, identifying the device by its serial number. The command also synchronizes the device with AWS by including the first two codes in sequence from the virtual MFA device.

```
$MFADevice = New-IAMVirtualMFADevice -VirtualMFADeviceName "MyMFADevice"
# see example for New-IAMVirtualMFADevice to see how to configure the software
 program with PNG or base32 seed code
Enable-IAMMFADevice -UserName "David" -SerialNumber -SerialNumber
 $MFADevice.SerialNumber -AuthenticationCode1 "24681357" -AuthenticationCode2
 "13572468"
```

- For API details, see EnableMfaDevice in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command enables the hardware MFA device with the serial number 987654321098 and associates the device with the user Bob. It includes the first two codes in sequence from the device.

```
Enable-IAMMFADevice -UserName "Bob" -SerialNumber "987654321098" -
AuthenticationCode1 "12345678" -AuthenticationCode2 "87654321"
```

Example 2: This example creates and enables a virtual MFA device. The first command creates the virtual device and returns the device's object representation in the variable `$MFADevice`. You can use the `.Base32StringSeed` or `QRCodePng` properties to configure the user's software application. The final command assigns the device to the user `David`, identifying the device by its serial number. The command also synchronizes the device with AWS by including the first two codes in sequence from the virtual MFA device.

```
$MFADevice = New-IAMVirtualMFADevice -VirtualMFADeviceName "MyMFADevice"
# see example for New-IAMVirtualMFADevice to see how to configure the software
 program with PNG or base32 seed code
Enable-IAMMFADevice -UserName "David" -SerialNumber -SerialNumber
 $MFADevice.SerialNumber -AuthenticationCode1 "24681357" -AuthenticationCode2
 "13572468"
```

- For API details, see EnableMfaDevice in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GenerateCredentialReport` with an AWS SDK or CLI

The following code examples show how to use `GenerateCredentialReport`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage your account

CLI

AWS CLI

To generate a credential report

The following example attempts to generate a credential report for the AWS account.

```
aws iam generate-credential-report
```

Output:

```
{
    "State":  "STARTED",
    "Description": "No report exists. Starting a new report generation task"
}
```

For more information, see Getting credential reports for your AWS account in the *AWS IAM User Guide*.

- For API details, see GenerateCredentialReport in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example requests generation of a new report, which can be done every four hours. If the last report is still recent the State field reads `COMPLETE`. Use `Get-IAMCredentialReport` to view the completed report.

```
Request-IAMCredentialReport
```

Output:

```
Description                                                    State
-----------                                                    -----
No report exists. Starting a new report generation task        STARTED
```

- For API details, see GenerateCredentialReport in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example requests generation of a new report, which can be done every four hours. If the last report is still recent the State field reads `COMPLETE`. Use `Get-IAMCredentialReport` to view the completed report.

```
Request-IAMCredentialReport
```

Output:

```
Description                                                    State
-----------                                                    -----
No report exists. Starting a new report generation task        STARTED
```

- For API details, see GenerateCredentialReport in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
def generate_credential_report():
    """
    Starts generation of a credentials report about the current account. After
    calling this function to generate the report, call get_credential_report
    to get the latest report. A new report can be generated a minimum of four
 hours
    after the last one was generated.
    """
    try:
        response = iam.meta.client.generate_credential_report()
        logger.info(
            "Generating credentials report for your account. " "Current state is
 %s.",
            response["State"],
        )
    except ClientError:
        logger.exception("Couldn't generate a credentials report for your
 account.")
        raise
    else:
        return response
```

- For API details, see GenerateCredentialReport in *AWS SDK for Python (Boto3) API Reference*.

SAP ABAP

SDK for SAP ABAP

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
TRY.
    oo_result = lo_iam->generatecredentialreport( ).
    MESSAGE 'Credential report generation started.' TYPE 'I'.
  CATCH /aws1/cx_iamlimitexceededex.
    MESSAGE 'Report generation limit exceeded.' TYPE 'E'.
  CATCH /aws1/cx_iamservicefailureex.
    MESSAGE 'Service failure when generating credential report.' TYPE 'E'.
ENDTRY.
```

- For API details, see GenerateCredentialReport in *AWS SDK for SAP ABAP API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GenerateServiceLastAccessedDetails` with a CLI

The following code examples show how to use `GenerateServiceLastAccessedDetails`.

CLI

AWS CLI

Example 1: To generate a service access report for a custom policy

The following `generate-service-last-accessed-details` example starts a background job to generate a report that lists the services accessed by IAM users and other entities with a custom policy named `intern-boundary`. You can display the report after it is created by running the `get-service-last-accessed-details` command.

```
aws iam generate-service-last-accessed-details \
    --arn arn:aws:iam::123456789012:policy/intern-boundary
```

Output:

```
{
    "JobId": "2eb6c2b8-7b4c-3xmp-3c13-03b72c8cdfdc"
}
```

Example 2: To generate a service access report for the AWS managed AdministratorAccess policy

The following `generate-service-last-accessed-details` example starts a background job to generate a report that lists the services accessed by IAM users and other entities with the AWS managed `AdministratorAccess` policy. You can display the report after it is created by running the `get-service-last-accessed-details` command.

```
aws iam generate-service-last-accessed-details \
    --arn arn:aws:iam::aws:policy/AdministratorAccess
```

Output:

```
{
    "JobId": "78b6c2ba-d09e-6xmp-7039-ecde30b26916"
}
```

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GenerateServiceLastAccessedDetails in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example is equivalent cmdlet of GenerateServiceLastAccessedDetails API. This provides with a job id which can be used in Get-IAMServiceLastAccessedDetail and Get-IAMServiceLastAccessedDetailWithEntity

```
Request-IAMServiceLastAccessedDetail -Arn arn:aws:iam::123456789012:user/TestUser
```

- For API details, see GenerateServiceLastAccessedDetails in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example is equivalent cmdlet of GenerateServiceLastAccessedDetails API. This provides with a job id which can be used in Get-IAMServiceLastAccessedDetail and Get-IAMServiceLastAccessedDetailWithEntity

```
Request-IAMServiceLastAccessedDetail -Arn arn:aws:iam::123456789012:user/TestUser
```

- For API details, see GenerateServiceLastAccessedDetails in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetAccessKeyLastUsed` with an AWS SDK or CLI

The following code examples show how to use `GetAccessKeyLastUsed`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage access keys

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::accessKeyLastUsed(const Aws::String &secretKeyID,
                                    const Aws::Client::ClientConfiguration
 &clientConfig) {
    Aws::IAM::IAMClient iam(clientConfig);
    Aws::IAM::Model::GetAccessKeyLastUsedRequest request;

    request.SetAccessKeyId(secretKeyID);

    Aws::IAM::Model::GetAccessKeyLastUsedOutcome outcome =
 iam.GetAccessKeyLastUsed(
            request);

    if (!outcome.IsSuccess()) {
        std::cerr << "Error querying last used time for access key " <<
                  secretKeyID << ":" << outcome.GetError().GetMessage() <<
 std::endl;
    }
    else {
        Aws::String lastUsedTimeString =
                outcome.GetResult()
                        .GetAccessKeyLastUsed()
                        .GetLastUsedDate()
                        .ToGmtString(Aws::Utils::DateFormat::ISO_8601);
        std::cout << "Access key " << secretKeyID << " last used at time " <<
                  lastUsedTimeString << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see GetAccessKeyLastUsed in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To retrieve information about when the specified access key was last used

The following example retrieves information about when the access key ABCDEXAMPLE was last used.

```
aws iam get-access-key-last-used \
    --access-key-id ABCDEXAMPLE
```

Output:

```
{
    "UserName":  "Bob",
    "AccessKeyLastUsed": {
        "Region": "us-east-1",
        "ServiceName": "iam",
        "LastUsedDate": "2015-06-16T22:45:00Z"
    }
}
```

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see GetAccessKeyLastUsed in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Get the access key.

```
import { GetAccessKeyLastUsedCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});
```

```
/**
 *
 * @param {string} accessKeyId
 */
export const getAccessKeyLastUsed = async (accessKeyId) => {
  const command = new GetAccessKeyLastUsedCommand({
    AccessKeyId: accessKeyId,
  });

  const response = await client.send(command);

  if (response.AccessKeyLastUsed?.LastUsedDate) {
    console.log(`
    ${accessKeyId} was last used by ${response.UserName} via
    the ${response.AccessKeyLastUsed.ServiceName} service on
    ${response.AccessKeyLastUsed.LastUsedDate.toISOString()}
    `);
  }

  return response;
};
```

- For API details, see GetAccountAuthorizationDetails in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example gets authorization details about the identities in the AWS account, and displays the element list of the returned object, including users, groups, and roles. For example, the `UserDetailList` property displays details about the users. Similar information is available in the `RoleDetailList` and `GroupDetailList` properties.

```
$Details=Get-IAMAccountAuthorizationDetail
$Details
```

Output:

```
GroupDetailList : {Administrators, Developers, Testers, Backup}
IsTruncated     : False
Marker          :
RoleDetailList  : {TestRole1, AdminRole, TesterRole, clirole...}
UserDetailList  : {Administrator, Bob, BackupToS3, }
```

```
$Details.UserDetailList
```

Output:

```
Arn            : arn:aws:iam::123456789012:user/Administrator
CreateDate     : 10/16/2014 9:03:09 AM
GroupList      : {Administrators}
Path           : /
UserId         : AIDACKCEVSQ6CEXAMPLE1
UserName       : Administrator
UserPolicyList : {}

Arn            : arn:aws:iam::123456789012:user/Bob

UserName        : BackupToS3
UserPolicyList : {BackupServicePermissionsToS3Buckets}
```

- For API details, see GetAccountAuthorizationDetails in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
def get_authorization_details(response_filter):
    """
    Gets an authorization detail report for the current account.

    :param response_filter: A list of resource types to include in the report,
 such
                            as users or roles. When not specified, all resources
                            are included.
    :return: The authorization detail report.
    """
    try:
        account_details = iam.meta.client.get_account_authorization_details(
```

```
            Filter=response_filter
        )
        logger.debug(account_details)
    except ClientError:
        logger.exception("Couldn't get details for your account.")
        raise
    else:
        return account_details
```

- For API details, see GetAccountAuthorizationDetails in *AWS SDK for Python (Boto3) API Reference*.

SAP ABAP

SDK for SAP ABAP

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   TRY.
       oo_result = lo_iam->getaccountauthdetails( ).
       MESSAGE 'Retrieved account authorization details.' TYPE 'I'.
     CATCH /aws1/cx_iamservicefailureex.
       MESSAGE 'Service failure when getting account authorization details.'
TYPE 'E'.
   ENDTRY.
```

- For API details, see GetAccountAuthorizationDetails in *AWS SDK for SAP ABAP API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetAccountPasswordPolicy` with an AWS SDK or CLI

The following code examples show how to use `GetAccountPasswordPolicy`.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Gets the IAM password policy for an AWS account.
    /// </summary>
    /// <returns>The PasswordPolicy for the AWS account.</returns>
    public async Task<PasswordPolicy> GetAccountPasswordPolicyAsync()
    {
        var response = await _IAMService.GetAccountPasswordPolicyAsync(new
GetAccountPasswordPolicyRequest());
        return response.PasswordPolicy;
    }
```

- For API details, see GetAccountPasswordPolicy in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To see the current account password policy

The following `get-account-password-policy` command displays details about the password policy for the current account.

```
aws iam get-account-password-policy
```

Output:

```
{
    "PasswordPolicy": {
        "AllowUsersToChangePassword": false,
        "RequireLowercaseCharacters": false,
        "RequireUppercaseCharacters": false,
        "MinimumPasswordLength": 8,
        "RequireNumbers": true,
        "RequireSymbols": true
    }
}
```

If no password policy is defined for the account, the command returns a `NoSuchEntity` error.

For more information, see Setting an account password policy for IAM users in the *AWS IAM User Guide*.

- For API details, see GetAccountPasswordPolicy in *AWS CLI Command Reference*.

Go

SDK for Go V2

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import (
 "context"
 "log"

 "github.com/aws/aws-sdk-go-v2/service/iam"
 "github.com/aws/aws-sdk-go-v2/service/iam/types"
)

// AccountWrapper encapsulates AWS Identity and Access Management (IAM) account
 actions
// used in the examples.
```

```
// It contains an IAM service client that is used to perform account actions.
type AccountWrapper struct {
 IamClient *iam.Client
}

// GetAccountPasswordPolicy gets the account password policy for the current
 account.
// If no policy has been set, a NoSuchEntityException is error is returned.
func (wrapper AccountWrapper) GetAccountPasswordPolicy(ctx context.Context)
 (*types.PasswordPolicy, error) {
 var pwPolicy *types.PasswordPolicy
 result, err := wrapper.IamClient.GetAccountPasswordPolicy(ctx,
  &iam.GetAccountPasswordPolicyInput{})
 if err != nil {
  log.Printf("Couldn't get account password policy. Here's why: %v\n", err)
 } else {
  pwPolicy = result.PasswordPolicy
 }
 return pwPolicy, err
}
```

- For API details, see GetAccountPasswordPolicy in *AWS SDK for Go API Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>

Get the account password policy.

```
import {
  GetAccountPasswordPolicyCommand,
  IAMClient,
```

```
} from "@aws-sdk/client-iam";

const client = new IAMClient({});

export const getAccountPasswordPolicy = async () => {
  const command = new GetAccountPasswordPolicyCommand({});

  const response = await client.send(command);
  console.log(response.PasswordPolicy);
  return response;
};
```

- For API details, see GetAccountPasswordPolicy in *AWS SDK for JavaScript API Reference*.

PHP

SDK for PHP

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
$uuid = uniqid();
$service = new IAMService();

    public function getAccountPasswordPolicy()
    {
        return $this->iamClient->getAccountPasswordPolicy();
    }
```

- For API details, see GetAccountPasswordPolicy in *AWS SDK for PHP API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns details about the password policy for the current account. If no password policy is defined for the account, the command returns a `NoSuchEntity` error.

```
Get-IAMAccountPasswordPolicy
```

Output:

```
AllowUsersToChangePassword : True
ExpirePasswords            : True
HardExpiry                 : False
MaxPasswordAge             : 90
MinimumPasswordLength      : 8
PasswordReusePrevention    : 20
RequireLowercaseCharacters : True
RequireNumbers             : True
RequireSymbols             : False
RequireUppercaseCharacters : True
```

- For API details, see GetAccountPasswordPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns details about the password policy for the current account. If no password policy is defined for the account, the command returns a `NoSuchEntity` error.

```
Get-IAMAccountPasswordPolicy
```

Output:

```
AllowUsersToChangePassword : True
ExpirePasswords            : True
HardExpiry                 : False
MaxPasswordAge             : 90
MinimumPasswordLength      : 8
PasswordReusePrevention    : 20
```

```
RequireLowercaseCharacters : True
RequireNumbers             : True
RequireSymbols             : False
RequireUppercaseCharacters : True
```

- For API details, see GetAccountPasswordPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetContextKeysForCustomPolicy` with a CLI

The following code examples show how to use `GetContextKeysForCustomPolicy`.

CLI

AWS CLI

Example 1: To list the context keys referenced by one or more custom JSON policies provided as a parameter on the command line

The following `get-context-keys-for-custom-policy` command parses each supplied policy and lists the context keys used by those policies. Use this command to identify which context key values you must supply to successfully use the policy simulator commands `simulate-custom-policy` and `simulate-custom-policy`. You can also retrieve the list of context keys used by all policies associated by an IAM user or role by using the

`get-context-keys-for-custom-policy` command. Parameter values that begin with `file://` instruct the command to read the file and use the contents as the value for the parameter instead of the file name itself.

```
aws iam get-context-keys-for-custom-policy \
    --policy-input-list '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/${aws:username}","Condition":{"DateGreaterThan":
{"aws:CurrentTime":"2015-08-16T12:00:00Z"}}}}'
```

Output:

```
{
    "ContextKeyNames": [
        "aws:username",
        "aws:CurrentTime"
    ]
}
```

Example 2: To list the context keys referenced by one or more custom JSON policies provided as a file input

The following `get-context-keys-for-custom-policy` command is the same as the previous example, except that the policies are provided in a file instead of as a parameter. Because the command expects a JSON list of strings, and not a list of JSON structures, the file must be structured as follows, although you can collapse it into one one.

```
[
    "Policy1",
    "Policy2"
]
```

So for example, a file that contains the policy from the previous example must look like the following. You must escape each embedded double-quote inside the policy string by preceding it with a backslash \".

```
[ "{\"Version\": \"2012-10-17\", \"Statement\": {\"Effect\": \"Allow
\", \"Action\": \"dynamodb:*\", \"Resource\": \"arn:aws:dynamodb:us-
west-2:128716708097:table/${aws:username}\", \"Condition\": {\"DateGreaterThan\":
 {\"aws:CurrentTime\": \"2015-08-16T12:00:00Z\"}}}}" ]
```

This file can then be submitted to the following command.

```
aws iam get-context-keys-for-custom-policy \
    --policy-input-list file://policyfile.json
```

Output:

```
{
    "ContextKeyNames": [
        "aws:username",
        "aws:CurrentTime"
    ]
}
```

For more information, see Using the IAM Policy Simulator (AWS CLI and AWS API) in the *AWS IAM User Guide*.

- For API details, see GetContextKeysForCustomPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example fetches all the context keys present in the provided policy json.In order to provide multiple policies you can provide as comma separated list of values.

```
$policy1 = '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/","Condition":{"DateGreaterThan":
{"aws:CurrentTime":"2015-08-16T12:00:00Z"}}}}'
$policy2 = '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/"}}'
Get-IAMContextKeysForCustomPolicy -PolicyInputList $policy1,$policy2
```

- For API details, see GetContextKeysForCustomPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example fetches all the context keys present in the provided policy json.In order to provide multiple policies you can provide as comma separated list of values.

```
$policy1 = '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/","Condition":{"DateGreaterThan":
{"aws:CurrentTime":"2015-08-16T12:00:00Z"}}}}'
$policy2 = '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/"}}'
Get-IAMContextKeysForCustomPolicy -PolicyInputList $policy1,$policy2
```

- For API details, see GetContextKeysForCustomPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetContextKeysForPrincipalPolicy` with a CLI

The following code examples show how to use `GetContextKeysForPrincipalPolicy`.

CLI

AWS CLI

To list the context keys referenced by all policies associated with an IAM principal

The following `get-context-keys-for-principal-policy` command retrieves all policies that are attached to the user `saanvi` and any groups she is a member of. It then parses each and lists the context keys used by those policies. Use this command to identify which context key values you must supply to successfully use the `simulate-custom-policy` and `simulate-principal-policy` commands. You can also retrieve the list of context keys used by an arbitrary JSON policy by using the `get-context-keys-for-custom-policy` command.

```
aws iam get-context-keys-for-principal-policy \
```

```
    --policy-source-arn arn:aws:iam::123456789012:user/saanvi
```

Output:

```
{
    "ContextKeyNames": [
        "aws:username",
        "aws:CurrentTime"
    ]
}
```

For more information, see Using the IAM Policy Simulator (AWS CLI and AWS API) in the *AWS IAM User Guide*.

- For API details, see GetContextKeysForPrincipalPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example fetches all the context keys present in the provided policy json and the policies attached to IAM entity(user/role etc.). For -PolicyInputList you can provide multiple values list as comma separated values.

```
$policy1 = '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/","Condition":{"DateGreaterThan":
{"aws:CurrentTime":"2015-08-16T12:00:00Z"}}}}'
$policy2 = '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/"}}'
Get-IAMContextKeysForPrincipalPolicy -PolicyInputList $policy1,$policy2 -
PolicySourceArn arn:aws:iam::852640994763:user/TestUser
```

- For API details, see GetContextKeysForPrincipalPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example fetches all the context keys present in the provided policy json and the policies attached to IAM entity(user/role etc.). For -PolicyInputList you can provide multiple values list as comma separated values.

```
$policy1 = '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/","Condition":{"DateGreaterThan":
{"aws:CurrentTime":"2015-08-16T12:00:00Z"}}}}'
$policy2 = '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/"}}'
Get-IAMContextKeysForPrincipalPolicy -PolicyInputList $policy1,$policy2 -
PolicySourceArn arn:aws:iam::852640994763:user/TestUser
```

- For API details, see GetContextKeysForPrincipalPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetCredentialReport` with an AWS SDK or CLI

The following code examples show how to use `GetCredentialReport`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage your account

CLI

AWS CLI

To get a credential report

This example opens the returned report and outputs it to the pipeline as an array of text lines.

```
aws iam get-credential-report
```

Output:

```
{
    "GeneratedTime":  "2015-06-17T19:11:50Z",
```

```
    "ReportFormat": "text/csv"
}
```

For more information, see Getting credential reports for your AWS account in the *AWS IAM User Guide*.

- For API details, see GetCredentialReport in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example opens the returned report and outputs it to the pipeline as an array of text lines. The first line is the header with comma-separated column names. Each successive row is the detail row for one user, with each field separated by commas. Before you can view the report, you must generate it with the `Request-IAMCredentialReport` cmdlet. To retrieve the report as a single string, use `-Raw` instead of `-AsTextArray`. The alias `-SplitLines` is also accepted for the `-AsTextArray` switch. For the full list of columns in the output consult the service API reference. Note that if you do not use `-AsTextArray` or `-SplitLines`, then you must extract the text from the `.Content` property using the .NET `StreamReader` class.

```
Request-IAMCredentialReport
```

Output:

```
Description                                                          State
-----------                                                          -----
No report exists. Starting a new report generation task              STARTED
```

```
Get-IAMCredentialReport -AsTextArray
```

Output:

```
 user,arn,user_creation_time,password_enabled,password_last_used,password_last_changed,pa
 root_account,arn:aws:iam::123456789012:root,2014-10-15T16:31:25+00:00,not_supported,2015

Use `GetGroup` with a CLI

The following code examples show how to use `GetGroup`.

CLI

AWS CLI

To get an IAM group

This example returns details about the IAM group `Admins`.

```
aws iam get-group \
    --group-name Admins
```

Output:

```
{
    "Group": {
        "Path": "/",
        "CreateDate": "2015-06-16T19:41:48Z",
        "GroupId": "AIDGPMS9RO4H3FEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:group/Admins",
        "GroupName": "Admins"
    },
    "Users": []
}
```

For more information, see IAM Identities (users, user groups, and roles) in the *AWS IAM User Guide*.

- For API details, see GetGroup in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns details about the IAM group `Testers`, including a collection of all the IAM users that belong to the group.

```
$results = Get-IAMGroup -GroupName "Testers"
$results
```

Output:

```
Group                                    IsTruncated           Marker
     Users
-----                                    -----------           ------
     -----
Amazon.IdentityManagement.Model.Group    False
     {Theresa, David}
```

```
$results.Group
```

Output:

```
Arn        : arn:aws:iam::123456789012:group/Testers
CreateDate : 12/10/2014 3:39:11 PM
GroupId    : 3RHNZZGQJ7QHMAEXAMPLE1
GroupName  : Testers
Path       : /
```

```
$results.Users
```

Output:

```
Arn              : arn:aws:iam::123456789012:user/Theresa
CreateDate       : 12/10/2014 3:39:27 PM
PasswordLastUsed : 1/1/0001 12:00:00 AM
Path             : /

UserName         : Theresa

Arn              : arn:aws:iam::123456789012:user/David
CreateDate       : 12/10/2014 3:39:27 PM
PasswordLastUsed : 3/19/2015 8:44:04 AM
Path             : /
UserId           : Y4FKWQCXTA52QEXAMPLE3
UserName         : David
```

- For API details, see GetGroup in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetGroupPolicy` with a CLI

The following code examples show how to use `GetGroupPolicy`.

CLI

AWS CLI

To get information about a policy attached to an IAM group

The following `get-group-policy` command gets information about the specified policy attached to the group named `Test-Group`.

```
aws iam get-group-policy \
    --group-name Test-Group \
    --policy-name S3-ReadOnly-Policy
```

Output:

```
{
    "GroupName": "Test-Group",
    "PolicyDocument": {
        "Statement": [
            {
                "Action": [
                    "s3:Get*",
                    "s3:List*"
                ],
                "Resource": "*",
                "Effect": "Allow"
            }
        ]
    },
    "PolicyName": "S3-ReadOnly-Policy"
}
```

For more information, see Managing IAM policies in the *AWS IAM User Guide*.

- For API details, see GetGroupPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns details about the embedded inline policy named `PowerUserAccess-Testers` for the group `Testers`. The `PolicyDocument` property is URL encoded. It is decoded in this example with the `UrlDecode` .NET method.

```
$results = Get-IAMGroupPolicy -GroupName Testers -PolicyName PowerUserAccess-
Testers
$results
```

Output:

```
GroupName     PolicyDocument
 PolicyName
---------     --------------
 ----------
Testers       %7B%0A%20%20%22Version%22%3A%20%222012-10-17%22%2C%0A%20...
 PowerUserAccess-Testers

[System.Reflection.Assembly]::LoadWithPartialName("System.Web.HttpUtility")
[System.Web.HttpUtility]::UrlDecode($results.PolicyDocument)
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ec2:DescribeInstances"
      ],
      "Resource": [
        "arn:aws:ec2:us-east-1:555555555555:instance/i-b188560f"
      ]
    }
  ]
}
```

- For API details, see GetGroupPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns details about the embedded inline policy named `PowerUserAccess-Testers` for the group `Testers`. The `PolicyDocument` property is URL encoded. It is decoded in this example with the `UrlDecode` .NET method.

```
$results = Get-IAMGroupPolicy -GroupName Testers -PolicyName PowerUserAccess-
Testers
$results
```

Output:

```
GroupName     PolicyDocument
 PolicyName
---------     --------------
 ----------
Testers       %7B%0A%20%20%22Version%22%3A%20%222012-10-17%22%2C%0A%20...
 PowerUserAccess-Testers

[System.Reflection.Assembly]::LoadWithPartialName("System.Web.HttpUtility")
[System.Web.HttpUtility]::UrlDecode($results.PolicyDocument)
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ec2:DescribeInstances"
      ],
      "Resource": [
        "arn:aws:ec2:us-east-1:555555555555:instance/i-b188560f"
      ]
    }
  ]
}
```

- For API details, see GetGroupPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetInstanceProfile` with a CLI

The following code examples show how to use `GetInstanceProfile`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Getting started with managed streaming

CLI

AWS CLI

To get information about an instance profile

The following `get-instance-profile` command gets information about the instance profile named `ExampleInstanceProfile`.

```
aws iam get-instance-profile \
    --instance-profile-name ExampleInstanceProfile
```

Output:

```
{
    "InstanceProfile": {
        "InstanceProfileId": "AID2MAB8DPLSRHEXAMPLE",
        "Roles": [
            {
                "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
                "RoleId": "AIDGPMS9RO4H3FEXAMPLE",
                "CreateDate": "2013-01-09T06:33:26Z",
                "RoleName": "Test-Role",
                "Path": "/",
                "Arn": "arn:aws:iam::336924118301:role/Test-Role"
            }
        ],
        "CreateDate": "2013-06-12T23:52:02Z",
        "InstanceProfileName": "ExampleInstanceProfile",
        "Path": "/",
        "Arn": "arn:aws:iam::336924118301:instance-profile/
ExampleInstanceProfile"
    }
```

```
}
```

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see GetInstanceProfile in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns details of the instance profile named `ec2instancerole` that is defined in the current AWS account.

```
Get-IAMInstanceProfile -InstanceProfileName ec2instancerole
```

Output:

```
Arn                 : arn:aws:iam::123456789012:instance-profile/ec2instancerole
CreateDate          : 2/17/2015 2:49:04 PM
InstanceProfileId   : HH36PTZQJUR32EXAMPLE1
InstanceProfileName : ec2instancerole
Path                : /
Roles               : {ec2instancerole}
```

- For API details, see GetInstanceProfile in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns details of the instance profile named `ec2instancerole` that is defined in the current AWS account.

```
Get-IAMInstanceProfile -InstanceProfileName ec2instancerole
```

Output:

```
Arn                 : arn:aws:iam::123456789012:instance-profile/ec2instancerole
CreateDate          : 2/17/2015 2:49:04 PM
InstanceProfileId   : HH36PTZQJUR32EXAMPLE1
InstanceProfileName : ec2instancerole
Path                : /
```

```
Roles               : {ec2instancerole}
```

- For API details, see GetInstanceProfile in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetLoginProfile` with a CLI

The following code examples show how to use `GetLoginProfile`.

CLI

AWS CLI

To get password information for an IAM user

The following `get-login-profile` command gets information about the password for the IAM user named Bob.

```
aws iam get-login-profile \
    --user-name Bob
```

Output:

```
{
    "LoginProfile": {
        "UserName": "Bob",
        "CreateDate": "2012-09-21T23:03:39Z"
    }
}
```

The `get-login-profile` command can be used to verify that an IAM user has a password. The command returns a `NoSuchEntity` error if no password is defined for the user.

You cannot view a password using this command. If the password is lost, you can reset the password (`update-login-profile`) for the user. Alternatively, you can delete the login profile (`delete-login-profile`) for the user and then create a new one (`create-login-profile`).

For more information, see Managing passwords for IAM users in the *AWS IAM User Guide*.

- For API details, see GetLoginProfile in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns the password creation date and whether a password reset is required for the IAM user `David`.

```
Get-IAMLoginProfile -UserName David
```

Output:

```
CreateDate                PasswordResetRequired                UserName
----------                ---------------------                --------
12/10/2014 3:39:44 PM     False                                David
```

- For API details, see GetLoginProfile in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns the password creation date and whether a password reset is required for the IAM user `David`.

```
Get-IAMLoginProfile -UserName David
```

Output:

```
CreateDate                PasswordResetRequired                UserName
----------                ---------------------                --------
12/10/2014 3:39:44 PM     False                                David
```

- For API details, see GetLoginProfile in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetOpenIdConnectProvider` with a CLI

The following code examples show how to use `GetOpenIdConnectProvider`.

CLI

AWS CLI

To return information about the specified OpenID Connect provider

This example returns details about the OpenID Connect provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/server.example.com`.

```
aws iam get-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com
```

Output:

```
{
    "Url": "server.example.com"
        "CreateDate": "2015-06-16T19:41:48Z",
        "ThumbprintList": [
        "12345abcdefghijk67890lmnopqrst987example"
        ],
        "ClientIDList": [
        "example-application-ID"
        ]
}
```

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see GetOpenIdConnectProvider in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns details about the OpenID Connect provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/accounts.google.com`. The

`ClientIDList` property is a collection that contains all the Client IDs defined for this provider.

```
Get-IAMOpenIDConnectProvider -OpenIDConnectProviderArn
 arn:aws:iam::123456789012:oidc-provider/oidc.example.com
```

Output:

```
ClientIDList         CreateDate                ThumbprintList
           Url
------------         ----------                --------------
           ---
{MyOIDCApp}          2/3/2015 3:00:30 PM
 {12345abcdefghijk67890lmnopqrst98765uvwxy}   oidc.example.com
```

- For API details, see GetOpenIdConnectProvider in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns details about the OpenID Connect provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/accounts.google.com`. The `ClientIDList` property is a collection that contains all the Client IDs defined for this provider.

```
Get-IAMOpenIDConnectProvider -OpenIDConnectProviderArn
 arn:aws:iam::123456789012:oidc-provider/oidc.example.com
```

Output:

```
ClientIDList         CreateDate                ThumbprintList
           Url
------------         ----------                --------------
           ---
{MyOIDCApp}          2/3/2015 3:00:30 PM
 {12345abcdefghijk67890lmnopqrst98765uvwxy}   oidc.example.com
```

- For API details, see GetOpenIdConnectProvider in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetPolicy` with an AWS SDK or CLI

The following code examples show how to use `GetPolicy`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Getting started with managed streaming
- Work with the IAM Policy Builder API

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Get information about an IAM policy.
    /// </summary>
    /// <param name="policyArn">The IAM policy to retrieve information for.</
param>
    /// <returns>The IAM policy.</returns>
    public async Task<ManagedPolicy> GetPolicyAsync(string policyArn)
    {

        var response = await _IAMService.GetPolicyAsync(new GetPolicyRequest
 { PolicyArn = policyArn });
        return response.Policy;
    }
```

- For API details, see GetPolicy in *AWS SDK for .NET API Reference*.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::getPolicy(const Aws::String &policyArn,
                            const Aws::Client::ClientConfiguration &clientConfig)
 {
    Aws::IAM::IAMClient iam(clientConfig);
    Aws::IAM::Model::GetPolicyRequest request;
    request.SetPolicyArn(policyArn);

    auto outcome = iam.GetPolicy(request);
    if (!outcome.IsSuccess()) {
        std::cerr << "Error getting policy " << policyArn << ": " <<
                  outcome.GetError().GetMessage() << std::endl;
    }
    else {
        const auto &policy = outcome.GetResult().GetPolicy();
        std::cout << "Name: " << policy.GetPolicyName() << std::endl <<
                  "ID: " << policy.GetPolicyId() << std::endl << "Arn: " <<
                  policy.GetArn() << std::endl << "Description: " <<
                  policy.GetDescription() << std::endl << "CreateDate: " <<

 policy.GetCreateDate().ToGmtString(Aws::Utils::DateFormat::ISO_8601)
                  << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see GetPolicy in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To retrieve information about the specified managed policy

This example returns details about the managed policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam get-policy \
    --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Output:

```
{
    "Policy": {
        "PolicyName": "MySamplePolicy",
        "CreateDate": "2015-06-17T19:23;32Z",
        "AttachmentCount": 0,
        "IsAttachable": true,
        "PolicyId": "Z27SI6FQMGNQ2EXAMPLE1",
        "DefaultVersionId": "v1",
        "Path": "/",
        "Arn": "arn:aws:iam::123456789012:policy/MySamplePolicy",
        "UpdateDate": "2015-06-17T19:23:32Z"
    }
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see GetPolicy in *AWS CLI Command Reference*.

Use `GetPolicyVersion` with an AWS SDK or CLI

The following code examples show how to use `GetPolicyVersion`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Manage policies
- Work with the IAM Policy Builder API

CLI

AWS CLI

To retrieve information about the specified version of the specified managed policy

This example returns the policy document for the v2 version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyManagedPolicy`.

```
aws iam get-policy-version \
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --version-id v2
```

Output:

```
{
    "PolicyVersion": {
        "Document": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Effect": "Allow",
                    "Action": "iam:*",
                    "Resource": "*"
```

```
                }
            ]
        },
        "VersionId": "v2",
        "IsDefaultVersion": true,
        "CreateDate": "2023-04-11T00:22:54+00:00"
    }
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see GetPolicyVersion in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns the policy document for the v2 version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyManagedPolicy`. The policy document in the `Document` property is URL encoded and is decoded in this example with the `UrlDecode` .NET method.

```
$results = Get-IAMPolicyVersion -PolicyArn arn:aws:iam::123456789012:policy/
MyManagedPolicy -VersionId v2
$results
```

Output:

```

Use `GetRole` with an AWS SDK or CLI

The following code examples show how to use `GetRole`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Configure container service connectivity
- Create a container task for the serverless launch type

- Creating a container service for virtual machine instances
- Get started with serverless data warehouses
- Getting started with internet of things device protection
- Getting started with machine learning feature stores
- Getting started with managed kubernetes clusters
- Getting started with managed streaming
- Getting started with provisioned data warehouse clusters
- Run CPU stress tests on virtual machine instances using fault injection

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
/// <summary>
/// Get information about an IAM role.
/// </summary>
/// <param name="roleName">The name of the IAM role to retrieve information
/// for.</param>
/// <returns>The IAM role that was retrieved.</returns>
public async Task<Role> GetRoleAsync(string roleName)
{
    var response = await _IAMService.GetRoleAsync(new GetRoleRequest
    {
        RoleName = roleName,
    });

    return response.Role;
}
```

- For API details, see GetRole in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To get information about an IAM role

The following `get-role` command gets information about the role named `Test-Role`.

```
aws iam get-role \
    --role-name Test-Role
```

Output:

```
{
    "Role": {
        "Description": "Test Role",
        "AssumeRolePolicyDocument":"<URL-encoded-JSON>",
        "MaxSessionDuration": 3600,
        "RoleId": "AROA1234567890EXAMPLE",
        "CreateDate": "2019-11-13T16:45:56Z",
        "RoleName": "Test-Role",
        "Path": "/",
        "RoleLastUsed": {
            "Region": "us-east-1",
            "LastUsedDate": "2019-11-13T17:14:00Z"
        },
        "Arn": "arn:aws:iam::123456789012:role/Test-Role"
    }
}
```

The command displays the trust policy attached to the role. To list the permissions policies attached to a role, use the `list-role-policies` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see GetRole in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns the details of the `lamda_exec_role`. It includes the trust policy document that specifies who can assume this role. The policy document is URL encoded and can be decoded using the .NET `UrlDecode` method. In this example, the original policy had all white space removed before it was uploaded to the policy. To see the permissions policy documents that determine what someone who assumes the role can do, use the `Get-IAMRolePolicy` for inline policies, and `Get-IAMPolicyVersion` for attached managed policies.

```
$results = Get-IamRole -RoleName lambda_exec_role
$results | Format-List
```

Output:

```
Arn                       : arn:aws:iam::123456789012:role/lambda_exec_role
AssumeRolePolicyDocument  : %7B%22Version%22%3A%222012-10-17%22%2C%22Statement

{"Version":"2012-10-17",       "Statement":
[{"Sid":"","Effect":"Allow","Principal":
{"Service":"lambda.amazonaws.com"},"Action":"sts:AssumeRole"}]}
```

- For API details, see GetRole in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns the details of the `lamda_exec_role`. It includes the trust policy document that specifies who can assume this role. The policy document is URL encoded and can be decoded using the .NET `UrlDecode` method. In this example, the original policy had all white space removed before it was uploaded to the policy. To see the permissions policy documents that determine what someone who assumes the role can do, use the `Get-IAMRolePolicy` for inline policies, and `Get-IAMPolicyVersion` for attached managed policies.

```
$results = Get-IamRole -RoleName lambda_exec_role
$results | Format-List
```

Output:

```
Arn                       : arn:aws:iam::123456789012:role/lambda_exec_role
```

```
AssumeRolePolicyDocument : %7B%22Version%22%3A%222012-10-17%22%2C%22Statement
%22%3A%5B%7B%22Sid%22
                           %3A%22%22%2C%22Effect%22%3A%22Allow%22%2C%22Principal
%22%3A%7B%22Service
                           %22%3A%22lambda.amazonaws.com%22%7D%2C%22Action%22%3A

Use `GetRolePolicy` with a CLI

The following code examples show how to use `GetRolePolicy`.

CLI

AWS CLI

To get information about a policy attached to an IAM role

The following `get-role-policy` command gets information about the specified policy attached to the role named `Test-Role`.

```
aws iam get-role-policy \
    --role-name Test-Role \
    --policy-name ExamplePolicy
```

Output:

```
{
  "RoleName": "Test-Role",
  "PolicyDocument": {
      "Statement": [
          {
              "Action": [
                  "s3:ListBucket",
                  "s3:Put*",
                  "s3:Get*",
                  "s3:*MultipartUpload*"
              ],
              "Resource": "*",
              "Effect": "Allow",
              "Sid": "1"
          }
      ]
  }
  "PolicyName": "ExamplePolicy"
}
```

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see GetRolePolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns the permissions policy document for the policy named `oneClick_lambda_exec_role_policy` that is embedded in the IAM role `lamda_exec_role`. The resulting policy document is URL encoded. It is decoded in this example with the `UrlDecode` .NET method.

```
$results = Get-IAMRolePolicy -RoleName lambda_exec_role -PolicyName
 oneClick_lambda_exec_role_policy
$results
```

Output:

```
PolicyDocument                                          PolicyName
              UserName
--------------                                          ----------
              --------
%7B%0A%20%20%22Version%22%3A%20%222012-10-17%22%2C%...
 oneClick_lambda_exec_role_policy     lambda_exec_role
```

```
[System.Reflection.Assembly]::LoadWithPartialName("System.Web.HttpUtility")
[System.Web.HttpUtility]::UrlDecode($results.PolicyDocument)
```

Output:

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "logs:*"
      ],
      "Resource": "arn:aws:logs:us-east-1:555555555555:log-group:/aws/lambda/aws-
example-function:*"
```

```
    },
    {
      "Effect": "Allow",
      "Action": [
        "s3:GetObject",
        "s3:PutObject"
      ],
      "Resource": [
        "arn:aws:s3:::amzn-s3-demo-bucket/*"
      ]
    }
  ]
}
```

- For API details, see GetRolePolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns the permissions policy document for the policy named oneClick_lambda_exec_role_policy that is embedded in the IAM role lamda_exec_role. The resulting policy document is URL encoded. It is decoded in this example with the UrlDecode .NET method.

```
$results = Get-IAMRolePolicy -RoleName lambda_exec_role -PolicyName
 oneClick_lambda_exec_role_policy
$results
```

Output:

```

Use `GetSamlProvider` with a CLI

The following code examples show how to use `GetSamlProvider`.

CLI

AWS CLI

To retrieve the SAML provider metadocument

This example retrieves the details about the SAML 2.0 provider whose ARM is `arn:aws:iam::123456789012:saml-provider/SAMLADFS`. The response includes

the metadata document that you got from the identity provider to create the AWS SAML provider entity as well as the creation and expiration dates.

```
aws iam get-saml-provider \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFS
```

Output:

```
{
    "SAMLMetadataDocument": "...SAMLMetadataDocument-XML...",
    "CreateDate": "2017-03-06T22:29:46+00:00",
    "ValidUntil": "2117-03-06T22:29:46.433000+00:00",
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see GetSamlProvider in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves the details about the SAML 2.0 provider whose ARM is arn:aws:iam::123456789012:saml-provider/SAMLADFS. The response includes the metadata document that you got from the identity provider to create the AWS SAML provider entity as well as the creation and expiration dates.

```
Get-IAMSAMLProvider -SAMLProviderArn arn:aws:iam::123456789012:saml-provider/
SAMLADFS
```

Output:

```
CreateDate                 SAMLMetadataDocument
        ValidUntil
----------                 --------------------
        ----------
12/23/2014 12:16:55 PM    <EntityDescriptor ID="_12345678-1234-5678-9012-
example1...    12/23/2114 12:16:54 PM
```

- For API details, see GetSamlProvider in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example retrieves the details about the SAML 2.0 provider whose ARM is arn:aws:iam::123456789012:saml-provider/SAMLADFS. The response includes the metadata document that you got from the identity provider to create the AWS SAML provider entity as well as the creation and expiration dates.

```

Use `GetServerCertificate` with an AWS SDK or CLI

The following code examples show how to use `GetServerCertificate`.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::getServerCertificate(const Aws::String &certificateName,
                                       const Aws::Client::ClientConfiguration
 &clientConfig) {
    Aws::IAM::IAMClient iam(clientConfig);
    Aws::IAM::Model::GetServerCertificateRequest request;
    request.SetServerCertificateName(certificateName);

    auto outcome = iam.GetServerCertificate(request);
    bool result = true;
    if (!outcome.IsSuccess()) {
        if (outcome.GetError().GetErrorType() !=
 Aws::IAM::IAMErrors::NO_SUCH_ENTITY) {
            std::cerr << "Error getting server certificate " << certificateName
 <<
                      ": " << outcome.GetError().GetMessage() << std::endl;
            result = false;
        }
        else {
            std::cout << "Certificate '" << certificateName
                      << "' not found." << std::endl;
        }
    }
    else {
        const auto &certificate = outcome.GetResult().GetServerCertificate();
        std::cout << "Name: " <<

 certificate.GetServerCertificateMetadata().GetServerCertificateName()
                  << std::endl << "Body: " << certificate.GetCertificateBody() <<
                  std::endl << "Chain: " << certificate.GetCertificateChain() <<
                  std::endl;
    }
```

```
    return result;
}
```

- For API details, see GetServerCertificate in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To get details about a server certificate in your AWS account

The following `get-server-certificate` command retrieves all of the details about the specified server certificate in your AWS account.

```
aws iam get-server-certificate \
    --server-certificate-name myUpdatedServerCertificate
```

Output:

```
{
    "ServerCertificate": {
        "ServerCertificateMetadata": {
            "Path": "/",
            "ServerCertificateName": "myUpdatedServerCertificate",

    }
}
```

To list the server certificates available in your AWS account, use the `list-server-certificates` command.

For more information, see Managing server certificates in IAM in the *AWS IAM User Guide*.

- For API details, see GetServerCertificate in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Get a server certificate.

```
import { GetServerCertificateCommand, IAMClient } from "@aws-sdk/client-iam";
```

```
const client = new IAMClient({});

/**
 *
 * @param {string} certName
 * @returns
 */
export const getServerCertificate = async (certName) => {
  const command = new GetServerCertificateCommand({
    ServerCertificateName: certName,
  });

  const response = await client.send(command);
  console.log(response);
  return response;
};
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see GetServerCertificate in *AWS SDK for JavaScript API Reference*.

SDK for JavaScript (v2)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// Load the AWS SDK for Node.js
var AWS = require("aws-sdk");
// Set the region
AWS.config.update({ region: "REGION" });

// Create the IAM service object
var iam = new AWS.IAM({ apiVersion: "2010-05-08" });

iam.getServerCertificate(
  { ServerCertificateName: "CERTIFICATE_NAME" },
  function (err, data) {
    if (err) {
```

```
      console.log("Error", err);
    } else {
      console.log("Success", data);
    }
  }
);
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see GetServerCertificate in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves details about the server certificate named `MyServerCertificate`. You can find the certificate details in the `CertificateBody` and `ServerCertificateMetadata` properties.

```
$result = Get-IAMServerCertificate -ServerCertificateName MyServerCertificate
$result | format-list
```

Output:

```

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetServiceLastAccessedDetails` with a CLI

The following code examples show how to use `GetServiceLastAccessedDetails`.

CLI

AWS CLI

To retrieve a service access report

The following `get-service-last-accessed-details` example retrieves a previously generated report that lists the services accessed by IAM entities. To generate a report, use the `generate-service-last-accessed-details` command.

```
aws iam get-service-last-accessed-details \
    --job-id 2eb6c2b8-7b4c-3xmp-3c13-03b72c8cdfdc
```

Output:

```
{
    "JobStatus": "COMPLETED",
    "JobCreationDate": "2019-10-01T03:50:35.929Z",
    "ServicesLastAccessed": [
        ...
        {
            "ServiceName": "AWS Lambda",
            "LastAuthenticated": "2019-09-30T23:02:00Z",
            "ServiceNamespace": "lambda",
            "LastAuthenticatedEntity": "arn:aws:iam::123456789012:user/admin",
            "TotalAuthenticatedEntities": 6
        },
    ]
}
```

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GetServiceLastAccessedDetails in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example provides details of the service last accessed by the IAM entity(user, group, role or policy) associated in Request call.

```
Request-IAMServiceLastAccessedDetail -Arn arn:aws:iam::123456789012:user/TestUser
```

Output:

```
f0b7a819-eab0-929b-dc26-ca598911cb9f
```

```
Get-IAMServiceLastAccessedDetail -JobId f0b7a819-eab0-929b-dc26-ca598911cb9f
```

- For API details, see GetServiceLastAccessedDetails in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example provides details of the service last accessed by the IAM entity(user, group, role or policy) associated in Request call.

```
Request-IAMServiceLastAccessedDetail -Arn arn:aws:iam::123456789012:user/TestUser
```

Output:

```
f0b7a819-eab0-929b-dc26-ca598911cb9f
```

```
Get-IAMServiceLastAccessedDetail -JobId f0b7a819-eab0-929b-dc26-ca598911cb9f
```

- For API details, see GetServiceLastAccessedDetails in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetServiceLastAccessedDetailsWithEntities` with a CLI

The following code examples show how to use `GetServiceLastAccessedDetailsWithEntities`.

CLI

AWS CLI

To retrieve a service access report with details for a service

The following `get-service-last-accessed-details-with-entities` example retrieves a report that contains details about IAM users and other entities that accessed the specified service. To generate a report, use the `generate-service-last-accessed-details` command. To get a list of services accessed with namespaces, use `get-service-last-accessed-details`.

```
aws iam get-service-last-accessed-details-with-entities \
    --job-id 78b6c2ba-d09e-6xmp-7039-ecde30b26916 \
    --service-namespace lambda
```

Output:

```
{
    "JobStatus": "COMPLETED",
    "JobCreationDate": "2019-10-01T03:55:41.756Z",
    "JobCompletionDate": "2019-10-01T03:55:42.533Z",
    "EntityDetailsList": [
        {
            "EntityInfo": {
                "Arn": "arn:aws:iam::123456789012:user/admin",
                "Name": "admin",
                "Type": "USER",
                "Id": "AIDAIO2XMPLENQEXAMPLE",
                "Path": "/"
            },
            "LastAuthenticated": "2019-09-30T23:02:00Z"
        },
```

```
        {
            "EntityInfo": {
                "Arn": "arn:aws:iam::123456789012:user/developer",
                "Name": "developer",
                "Type": "USER",
                "Id": "AIDAIBEYXMPL2YEXAMPLE",
                "Path": "/"
            },
            "LastAuthenticated": "2019-09-16T19:34:00Z"
        }
    ]
}
```

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GetServiceLastAccessedDetailsWithEntities in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example provides the last accessed timestamp for the service in the request by that respective IAM entity.

```
$results = Get-IAMServiceLastAccessedDetailWithEntity -JobId f0b7a819-eab0-929b-
dc26-ca598911cb9f -ServiceNamespace ec2
$results
```

Output:

```
EntityDetailsList : {Amazon.IdentityManagement.Model.EntityDetails}
Error             :
IsTruncated       : False
JobCompletionDate : 12/29/19 11:19:31 AM
JobCreationDate   : 12/29/19 11:19:31 AM
JobStatus         : COMPLETED
Marker            :
```

```
$results.EntityDetailsList
```

Output:

```
EntityInfo                                    LastAuthenticated
----------                                    -----------------
Amazon.IdentityManagement.Model.EntityInfo 11/16/19 3:47:00 PM
```

```
$results.EntityInfo
```

Output:

```
Arn  : arn:aws:iam::123456789012:user/TestUser
Id   : AIDA4NBK5CXF5TZHU1234
Name : TestUser
Path : /
Type : USER
```

- For API details, see GetServiceLastAccessedDetailsWithEntities in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example provides the last accessed timestamp for the service in the request by that respective IAM entity.

```
$results = Get-IAMServiceLastAccessedDetailWithEntity -JobId f0b7a819-eab0-929b-
dc26-ca598911cb9f -ServiceNamespace ec2
$results
```

Output:

```
EntityDetailsList : {Amazon.IdentityManagement.Model.EntityDetails}
Error             :
IsTruncated       : False
JobCompletionDate : 12/29/19 11:19:31 AM
JobCreationDate   : 12/29/19 11:19:31 AM
JobStatus         : COMPLETED
Marker            :
```

```
$results.EntityDetailsList
```

Output:

```
EntityInfo                                    LastAuthenticated
----------                                    -----------------
Amazon.IdentityManagement.Model.EntityInfo 11/16/19 3:47:00 PM
```

```
$results.EntityInfo
```

Output:

```
Arn  : arn:aws:iam::123456789012:user/TestUser
Id   : AIDA4NBK5CXF5TZHU1234
Name : TestUser
Path : /
Type : USER
```

- For API details, see GetServiceLastAccessedDetailsWithEntities in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetServiceLinkedRoleDeletionStatus` with an AWS SDK or CLI

The following code examples show how to use `GetServiceLinkedRoleDeletionStatus`.

CLI

AWS CLI

To check the status of a request to delete a service-linked role

The following `get-service-linked-role-deletion-status` example displays the status of a previously request to delete a service-linked role. The delete operation occurs asynchronously. When you make the request, you get a `DeletionTaskId` value that you provide as a parameter for this command.

```
aws iam get-service-linked-role-deletion-status \
```

```
    --deletion-task-id task/aws-service-role/lex.amazonaws.com/
AWSServiceRoleForLexBots/1a2b3c4d-1234-abcd-7890-abcdeEXAMPLE
```

Output:

```
{
"Status": "SUCCEEDED"
}
```

For more information, see Using service-linked roles in the *AWS IAM User Guide*.

- For API details, see GetServiceLinkedRoleDeletionStatus in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import {
  GetServiceLinkedRoleDeletionStatusCommand,
  IAMClient,
} from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} deletionTaskId
 */
export const getServiceLinkedRoleDeletionStatus = (deletionTaskId) => {
  const command = new GetServiceLinkedRoleDeletionStatusCommand({
    DeletionTaskId: deletionTaskId,
  });

  return client.send(command);
};
```

- For API details, see GetServiceLinkedRoleDeletionStatus in *AWS SDK for JavaScript API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetUser` with an AWS SDK or CLI

The following code examples show how to use `GetUser`.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Get information about an IAM user.
    /// </summary>
    /// <param name="userName">The username of the user.</param>
    /// <returns>An IAM user object.</returns>
    public async Task<User> GetUserAsync(string userName)
    {
        var response = await _IAMService.GetUserAsync(new GetUserRequest
{ UserName = userName });
        return response.User;
    }
```

- For API details, see GetUser in *AWS SDK for .NET API Reference*.

Bash

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
##############################################################################
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
##############################################################################
function errecho() {
  printf "%s\n" "$*" 1>&2
}

##############################################################################
# function iam_user_exists
#
# This function checks to see if the specified AWS Identity and Access Management
 (IAM) user already exists.
#
# Parameters:
#       $1 - The name of the IAM user to check.
#
# Returns:
#       0 - If the user already exists.
#       1 - If the user doesn't exist.
##############################################################################
function iam_user_exists() {
  local user_name
  user_name=$1

  # Check whether the IAM user already exists.
  # We suppress all output - we're interested only in the return code.

  local errors
  errors=$(aws iam get-user \
    --user-name "$user_name" 2>&1 >/dev/null)
```

```
  local error_code=${?}

  if [[ $error_code -eq 0 ]]; then
    return 0 # 0 in Bash script means true.
  else
    if [[ $errors != *"error"*"(NoSuchEntity)"* ]]; then
      aws_cli_error_log $error_code
      errecho "Error calling iam get-user $errors"
    fi

    return 1 # 1 in Bash script means false.
  fi
}
```

- For API details, see GetUser in *AWS CLI Command Reference*.

CLI

AWS CLI

To get information about an IAM user

The following `get-user` command gets information about the IAM user named `Paulo`.

```
aws iam get-user \
    --user-name Paulo
```

Output:

```
{
    "User": {
        "UserName": "Paulo",
        "Path": "/",
        "CreateDate": "2019-09-21T23:03:13Z",
        "UserId": "AIDA123456789EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:user/Paulo"
    }
}
```

For more information, see Managing IAM users in the *AWS IAM User Guide*.

- For API details, see GetUser in *AWS CLI Command Reference*.

Go

```
import AWSIAM
```

```
import AWSS3

    public func getUser(name: String? = nil) async throws -> IAMClientTypes.User
 {
        let input = GetUserInput(
            userName: name
        )
        do {
            let output = try await iamClient.getUser(input: input)
            guard let user = output.user else {
                throw ServiceHandlerError.noSuchUser
            }
            return user
        } catch {
            print("ERROR: getUser:", dump(error))
            throw error
        }
    }
```

- For API details, see GetUser in *AWS SDK for Swift API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetUserPolicy` with a CLI

The following code examples show how to use `GetUserPolicy`.

CLI

AWS CLI

To list policy details for an IAM user

The following `get-user-policy` command lists the details of the specified policy that is attached to the IAM user named Bob.

```
aws iam get-user-policy \
    --user-name Bob \
```

```
    --policy-name ExamplePolicy
```

Output:

```
{
    "UserName": "Bob",
    "PolicyName": "ExamplePolicy",
    "PolicyDocument": {
        "Version":"2012-10-17",
        "Statement": [
            {
                "Action": "*",
                "Resource": "*",
                "Effect": "Allow"
            }
        ]
    }
}
```

To get a list of policies for an IAM user, use the `list-user-policies` command.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see GetUserPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves the details of the inline policy named `Davids_IAM_Admin_Policy` that is embedded in the IAM user named `David`. The policy document is URL encoded.

```
$results = Get-IAMUserPolicy -PolicyName Davids_IAM_Admin_Policy -UserName David
$results
```

Output:

        const Aws::String DATE_FORMAT = "%Y-%m-%d";

        for (const auto &key: keys) {
            Aws::String statusString =
                    Aws::IAM::Model::StatusTypeMapper::GetNameForStatusType(
                            key.GetStatus());
            std::cout << std::left << std::setw(32) << key.GetUserName() <<
```

```
                        std::setw(30) << key.GetAccessKeyId() << std::setw(20) <<
                        statusString << std::setw(20) <<
                        key.GetCreateDate().ToGmtString(DATE_FORMAT.c_str()) <<
 std::endl;
        }

        if (outcome.GetResult().GetIsTruncated()) {
            request.SetMarker(outcome.GetResult().GetMarker());
        }
        else {
            done = true;
        }
    }

    return true;
}
```

- For API details, see ListAccessKeys in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To list the access key IDs for an IAM user

The following `list-access-keys` command lists the access keys IDs for the IAM user named Bob.

```
aws iam list-access-keys \
    --user-name Bob
```

Output:

```
{
    "AccessKeyMetadata": [
        {
            "UserName": "Bob",
            "Status": "Active",
            "CreateDate": "2013-06-04T18:17:34Z",
            "AccessKeyId": "AKIAIOSFODNN7EXAMPLE"
        },
```

```
        {
            "UserName": "Bob",
            "Status": "Inactive",
            "CreateDate": "2013-06-06T20:42:26Z",
            "AccessKeyId": "AKIAI44QH8DHBEXAMPLE"
        }
    ]
}
```

You cannot list the secret access keys for IAM users. If the secret access keys are lost, you must create new access keys using the `create-access-keys` command.

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see ListAccessKeys in *AWS CLI Command Reference*.

Use `ListAccountAliases` with an AWS SDK or CLI

The following code examples show how to use `ListAccountAliases`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage your account

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool
AwsDoc::IAM::listAccountAliases(const Aws::Client::ClientConfiguration
 &clientConfig) {
    Aws::IAM::IAMClient iam(clientConfig);
    Aws::IAM::Model::ListAccountAliasesRequest request;

    bool done = false;
    bool header = false;
```

```
    while (!done) {
        auto outcome = iam.ListAccountAliases(request);
        if (!outcome.IsSuccess()) {
            std::cerr << "Failed to list account aliases: " <<
                      outcome.GetError().GetMessage() << std::endl;
            return false;
        }

        const auto &aliases = outcome.GetResult().GetAccountAliases();
        if (!header) {
            if (aliases.size() == 0) {
                std::cout << "Account has no aliases" << std::endl;
                break;
            }
            std::cout << std::left << std::setw(32) << "Alias" << std::endl;
            header = true;
        }

        for (const auto &alias: aliases) {
            std::cout << std::left << std::setw(32) << alias << std::endl;
        }

        if (outcome.GetResult().GetIsTruncated()) {
            request.SetMarker(outcome.GetResult().GetMarker());
        }
        else {
            done = true;
        }
    }

    return true;
}
```

- For API details, see ListAccountAliases in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To list account aliases

The following `list-account-aliases` command lists the aliases for the current account.

```
aws iam list-account-aliases
```

Output:

```
{
    "AccountAliases": [
    "mycompany"
    ]
}
```

For more information, see Your AWS account ID and its alias in the *AWS IAM User Guide*.

- For API details, see ListAccountAliases in *AWS CLI Command Reference*.

Use `ListAttachedGroupPolicies` with a CLI

The following code examples show how to use `ListAttachedGroupPolicies`.

CLI

AWS CLI

To list all managed policies that are attached to the specified group

This example returns the names and ARNs of the managed policies that are attached to the IAM group named `Admins` in the AWS account.

```
aws iam list-attached-group-policies \
    --group-name Admins
```

Output:

```
{
    "AttachedPolicies": [
        {
            "PolicyName": "AdministratorAccess",
            "PolicyArn": "arn:aws:iam::aws:policy/AdministratorAccess"
        },
        {
            "PolicyName": "SecurityAudit",
            "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListAttachedGroupPolicies in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command returns the names and ARNs of the managed policies that are attached to the IAM group named `Admins` in the AWS account. To see the list of inline policies embedded in the group, use the `Get-IAMGroupPolicyList` command.

```
Get-IAMAttachedGroupPolicyList -GroupName "Admins"
```

Output:

```
PolicyArn                                                 PolicyName
---------                                                 ----------
arn:aws:iam::aws:policy/SecurityAudit                     SecurityAudit
arn:aws:iam::aws:policy/AdministratorAccess               AdministratorAccess
```

- For API details, see ListAttachedGroupPolicies in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command returns the names and ARNs of the managed policies that are attached to the IAM group named `Admins` in the AWS account. To see the list of inline policies embedded in the group, use the `Get-IAMGroupPolicyList` command.

```
Get-IAMAttachedGroupPolicyList -GroupName "Admins"
```

Output:

```
PolicyArn                                                 PolicyName
---------                                                 ----------
arn:aws:iam::aws:policy/SecurityAudit                     SecurityAudit
arn:aws:iam::aws:policy/AdministratorAccess               AdministratorAccess
```

- For API details, see ListAttachedGroupPolicies in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListAttachedRolePolicies` with an AWS SDK or CLI

The following code examples show how to use `ListAttachedRolePolicies`.

.NET

Example 1: This command returns the names and ARNs of the managed policies attached to the IAM role named `SecurityAuditRole` in the AWS account. To see the list of inline policies that are embedded in the role, use the `Get-IAMRolePolicyList` command.

```
Get-IAMAttachedRolePolicyList -RoleName "SecurityAuditRole"
```

Output:

```
PolicyArn                                                 PolicyName
---------                                                 ----------
arn:aws:iam::aws:policy/SecurityAudit                     SecurityAudit
```

- For API details, see ListAttachedRolePolicies in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Use `ListAttachedUserPolicies` with a CLI

The following code examples show how to use `ListAttachedUserPolicies`.

CLI

AWS CLI

To list all managed policies that are attached to the specified user

This command returns the names and ARNs of the managed policies for the IAM user named Bob in the AWS account.

```
aws iam list-attached-user-policies \
    --user-name Bob
```

Output:

```
{
    "AttachedPolicies": [
        {
            "PolicyName": "AdministratorAccess",
            "PolicyArn": "arn:aws:iam::aws:policy/AdministratorAccess"
        },
```

```
        {
            "PolicyName": "SecurityAudit",
            "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListAttachedUserPolicies in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command returns the names and ARNs of the managed policies for the IAM user named Bob in the AWS account. To see the list of inline policies that are embedded in the IAM user, use the `Get-IAMUserPolicyList` command.

```
Get-IAMAttachedUserPolicyList -UserName "Bob"
```

Output:

```
PolicyArn                                                PolicyName
---------                                                ----------
arn:aws:iam::aws:policy/TesterPolicy                     TesterPolicy
```

- For API details, see ListAttachedUserPolicies in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command returns the names and ARNs of the managed policies for the IAM user named Bob in the AWS account. To see the list of inline policies that are embedded in the IAM user, use the `Get-IAMUserPolicyList` command.

```
Get-IAMAttachedUserPolicyList -UserName "Bob"
```

Output:

```
PolicyArn                                                  PolicyName
---------                                                  ----------
arn:aws:iam::aws:policy/TesterPolicy                       TesterPolicy
```

- For API details, see ListAttachedUserPolicies in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListEntitiesForPolicy` with a CLI

The following code examples show how to use `ListEntitiesForPolicy`.

CLI

AWS CLI

To list all users, groups, and roles that the specified managed policy is attached to

This example returns a list of IAM groups, roles, and users who have the policy `arn:aws:iam::123456789012:policy/TestPolicy` attached.

```
aws iam list-entities-for-policy \
    --policy-arn arn:aws:iam::123456789012:policy/TestPolicy
```

Output:

```
{
    "PolicyGroups": [
        {
            "GroupName": "Admins",
            "GroupId": "AGPACKCEVSQ6C2EXAMPLE"
        }
    ],
    "PolicyUsers": [
        {
            "UserName": "Alice",
            "UserId": "AIDACKCEVSQ6C2EXAMPLE"
        }
```

```
    ],
    "PolicyRoles": [
        {
            "RoleName": "DevRole",
            "RoleId": "AROADBQP57FF2AEXAMPLE"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListEntitiesForPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns a list of IAM groups, roles, and users who have the policy `arn:aws:iam::123456789012:policy/TestPolicy` attached.

```
Get-IAMEntitiesForPolicy -PolicyArn "arn:aws:iam::123456789012:policy/TestPolicy"
```

Output:

```
IsTruncated  : False
Marker       :
PolicyGroups : {}
PolicyRoles  : {testRole}
PolicyUsers  : {Bob, Theresa}
```

- For API details, see ListEntitiesForPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns a list of IAM groups, roles, and users who have the policy `arn:aws:iam::123456789012:policy/TestPolicy` attached.

```
Get-IAMEntitiesForPolicy -PolicyArn "arn:aws:iam::123456789012:policy/TestPolicy"
```

Output:

```
IsTruncated  : False
Marker       :
PolicyGroups : {}
PolicyRoles  : {testRole}
PolicyUsers  : {Bob, Theresa}
```

- For API details, see ListEntitiesForPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListGroupPolicies` with a CLI

The following code examples show how to use `ListGroupPolicies`.

CLI

AWS CLI

To list all inline policies that are attached to the specified group

The following `list-group-policies` command lists the names of inline policies that are attached to the IAM group named `Admins` in the current account.

```
aws iam list-group-policies \
    --group-name Admins
```

Output:

```
{
    "PolicyNames": [
        "AdminRoot",
        "ExamplePolicy"
    ]
}
```

For more information, see Managing IAM policies in the *AWS IAM User Guide*.

- For API details, see ListGroupPolicies in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns a list of the inline policies that are embedded in the group `Testers`. To get the managed policies that are attached to the group, use the command `Get-IAMAttachedGroupPolicyList`.

```
Get-IAMGroupPolicyList -GroupName Testers
```

Output:

```
Deny-Assume-S3-Role-In-Production
PowerUserAccess-Testers
```

- For API details, see ListGroupPolicies in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns a list of the inline policies that are embedded in the group `Testers`. To get the managed policies that are attached to the group, use the command `Get-IAMAttachedGroupPolicyList`.

```
Get-IAMGroupPolicyList -GroupName Testers
```

Output:

```
Deny-Assume-S3-Role-In-Production
PowerUserAccess-Testers
```

- For API details, see ListGroupPolicies in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListGroups` with an AWS SDK or CLI

The following code examples show how to use `ListGroups`.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// List IAM groups.
    /// </summary>
    /// <returns>A list of IAM groups.</returns>
    public async Task<List<Group>> ListGroupsAsync()
    {
        var groupsPaginator = _IAMService.Paginators.ListGroups(new
ListGroupsRequest());
        var groups = new List<Group>();

        await foreach (var response in groupsPaginator.Responses)
        {
            groups.AddRange(response.Groups);
        }

        return groups;
    }
```

- For API details, see ListGroups in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To list the IAM groups for the current account

The following `list-groups` command lists the IAM groups in the current account.

```
aws iam list-groups
```

Output:

```
{
    "Groups": [
        {
            "Path": "/",
            "CreateDate": "2013-06-04T20:27:27.972Z",
            "GroupId": "AIDACKCEVSQ6C2EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/Admins",
            "GroupName": "Admins"
        },
        {
            "Path": "/",
            "CreateDate": "2013-04-16T20:30:42Z",
            "GroupId": "AIDGPMS9RO4H3FEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/S3-Admins",
            "GroupName": "S3-Admins"
        }
    ]
}
```

For more information, see Managing IAM user groups in the *AWS IAM User Guide*.

- For API details, see ListGroups in *AWS CLI Command Reference*.

Swift

SDK for Swift

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import AWSIAM
import AWSS3

    public func listGroups() async throws -> [String] {
        var groupList: [String] = []

        // Use "Paginated" to get all the groups.
        // This lets the SDK handle the 'isTruncated' property in
 "ListGroupsOutput".
        let input = ListGroupsInput()

        let pages = client.listGroupsPaginated(input: input)
        do {
            for try await page in pages {
                guard let groups = page.groups else {
                    print("Error: no groups returned.")
                    continue
                }

                for group in groups {
```

```
                    if let name = group.groupName {
                        groupList.append(name)
                    }
                }
            }
        } catch {
            print("ERROR: listGroups:", dump(error))
            throw error
        }
        return groupList
    }
```

- For API details, see ListGroups in *AWS SDK for Swift API reference*.

Use `ListGroupsForUser` with a CLI

The following code examples show how to use `ListGroupsForUser`.

CLI

AWS CLI

To list the groups that an IAM user belongs to

The following `list-groups-for-user` command displays the groups that the IAM user named Bob belongs to.

```
aws iam list-groups-for-user \
    --user-name Bob
```

Output:

```
{
    "Groups": [
        {
            "Path": "/",
            "CreateDate": "2013-05-06T01:18:08Z",
```

```
            "GroupId": "AKIAIOSFODNN7EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/Admin",
            "GroupName": "Admin"
        },
        {
            "Path": "/",
            "CreateDate": "2013-05-06T01:37:28Z",
            "GroupId": "AKIAI44QH8DHBEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/s3-Users",
            "GroupName": "s3-Users"
        }
    ]
}
```

For more information, see Managing IAM user groups in the *AWS IAM User Guide*.

- For API details, see ListGroupsForUser in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns the list of IAM groups that the IAM user `David` belongs to.

```
Get-IAMGroupForUser -UserName David
```

Output:

```
Arn        : arn:aws:iam::123456789012:group/Administrators
CreateDate : 10/20/2014 10:06:24 AM
GroupId    : 6WCH4TRY3KIHIEXAMPLE1
GroupName  : Administrators
Path       : /

Arn        : arn:aws:iam::123456789012:group/Testers
CreateDate : 12/10/2014 3:39:11 PM
GroupId    : RHNZZGQJ7QHMAEXAMPLE2
GroupName  : Testers
Path       : /

Arn        : arn:aws:iam::123456789012:group/Developers
CreateDate : 12/10/2014 3:38:55 PM
```

```
GroupId    : ZU2EOWMK6WBZOEXAMPLE3
GroupName  : Developers
Path       : /
```

- For API details, see ListGroupsForUser in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns the list of IAM groups that the IAM user `David` belongs to.

```
Get-IAMGroupForUser -UserName David
```

Output:

```
Arn        : arn:aws:iam::123456789012:group/Administrators
CreateDate : 10/20/2014 10:06:24 AM
GroupId    : 6WCH4TRY3KIHIEXAMPLE1

                    "RoleId": "AROAINUBC5O7XLEXAMPLE",
                    "Arn": "arn:aws:iam::123456789012:role/example-s3-role",
                    "CreateDate": "2023-09-21T18:18:49+00:00",
                    "AssumeRolePolicyDocument": {
                        "Version":"2012-10-17",
                        "Statement": [
                            {
                                "Effect": "Allow",
                                "Principal": {
                                    "Service": "ec2.amazonaws.com"
                                },
                                "Action": "sts:AssumeRole"
                            }
                        ]
                    }
                }
            ]
        }
    ]
}
```

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see ListInstanceProfiles in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns a collection of the instance profiles defined in the current AWS account.

```
Get-IAMInstanceProfileList
```

Output:

```
Arn                 : arn:aws:iam::123456789012:instance-profile/ec2instancerole
CreateDate          : 2/17/2015 2:49:04 PM
InstanceProfileId   : HH36PTZQJUR32EXAMPLE1
InstanceProfileName : ec2instancerole
Path                : /
Roles               : {ec2instancerole}
```

- For API details, see ListInstanceProfiles in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns a collection of the instance profiles defined in the current AWS account.

```
Get-IAMInstanceProfileList
```

Output:

```
Arn                 : arn:aws:iam::123456789012:instance-profile/ec2instancerole
CreateDate          : 2/17/2015 2:49:04 PM
InstanceProfileId   : HH36PTZQJUR32EXAMPLE1
InstanceProfileName : ec2instancerole
Path                : /
Roles               : {ec2instancerole}
```

- For API details, see ListInstanceProfiles in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListInstanceProfilesForRole` with a CLI

The following code examples show how to use `ListInstanceProfilesForRole`.

CLI

AWS CLI

To list the instance profiles for an IAM role

The following `list-instance-profiles-for-role` command lists the instance profiles that are associated with the role `Test-Role`.

```
aws iam list-instance-profiles-for-role \
    --role-name Test-Role
```

Output:

```
{
    "InstanceProfiles": [
        {
            "InstanceProfileId": "AIDGPMS9RO4H3FEXAMPLE",
            "Roles": [
                {
                    "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
                    "RoleId": "AIDACKCEVSQ6C2EXAMPLE",
                    "CreateDate": "2013-06-07T20:42:15Z",
                    "RoleName": "Test-Role",
                    "Path": "/",
                    "Arn": "arn:aws:iam::123456789012:role/Test-Role"
                }
            ],
            "CreateDate": "2013-06-07T21:05:24Z",
            "InstanceProfileName": "ExampleInstanceProfile",
            "Path": "/",
            "Arn": "arn:aws:iam::123456789012:instance-profile/
ExampleInstanceProfile"
        }
    ]
}
```

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see ListInstanceProfilesForRole in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns details of the instance profile associated with the role `ec2instancerole`.

```
Get-IAMInstanceProfileForRole -RoleName ec2instancerole
```

Output:

```
      Arn                 : arn:aws:iam::123456789012:instance-profile/
ec2instancerole
      CreateDate          : 2/17/2015 2:49:04 PM
      InstanceProfileId   : HH36PTZQJUR32EXAMPLE1
      InstanceProfileName : ec2instancerole
      Path                : /
      Roles               : {ec2instancerole}
```

- For API details, see ListInstanceProfilesForRole in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns details of the instance profile associated with the role `ec2instancerole`.

```
Get-IAMInstanceProfileForRole -RoleName ec2instancerole
```

Output:

```
      Arn                 : arn:aws:iam::123456789012:instance-profile/
ec2instancerole
      CreateDate          : 2/17/2015 2:49:04 PM
      InstanceProfileId   : HH36PTZQJUR32EXAMPLE1
      InstanceProfileName : ec2instancerole
      Path                : /
      Roles               : {ec2instancerole}
```

- For API details, see ListInstanceProfilesForRole in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListMfaDevices` with a CLI

The following code examples show how to use `ListMfaDevices`.

CLI

AWS CLI

To list all MFA devices for a specified user

This example returns details about the MFA device assigned to the IAM user Bob.

```
aws iam list-mfa-devices \
    --user-name Bob
```

Output:

```
{
    "MFADevices": [
        {
            "UserName": "Bob",
            "SerialNumber": "arn:aws:iam::123456789012:mfa/Bob",
            "EnableDate": "2019-10-28T20:37:09+00:00"
        },
        {
            "UserName": "Bob",
            "SerialNumber": "GAKT12345678",
            "EnableDate": "2023-02-18T21:44:42+00:00"
        },
        {
            "UserName": "Bob",
            "SerialNumber": "arn:aws:iam::123456789012:u2f/user/Bob/
fidosecuritykey1-7XNL7NFNLZ123456789EXAMPLE",
            "EnableDate": "2023-09-19T02:25:35+00:00"
        },
        {
            "UserName": "Bob",
            "SerialNumber": "arn:aws:iam::123456789012:u2f/user/Bob/
fidosecuritykey2-VDRQTDBBN5123456789EXAMPLE",
            "EnableDate": "2023-09-19T01:49:18+00:00"
        }
    ]
}
```

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see ListMfaDevices in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns details about the MFA device assigned to the IAM user `David`. In this example you can tell that it is a virtual device because the `SerialNumber` is an ARN instead of a physical device's actual serial number.

```
Get-IAMMFADevice -UserName David
```

Output:

```
EnableDate                SerialNumber                              UserName
----------                ------------                              --------
4/8/2015 9:41:10 AM       arn:aws:iam::123456789012:mfa/David       David
```

- For API details, see ListMfaDevices in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns details about the MFA device assigned to the IAM user `David`. In this example you can tell that it is a virtual device because the `SerialNumber` is an ARN instead of a physical device's actual serial number.

```
Get-IAMMFADevice -UserName David
```

Output:

```
EnableDate                SerialNumber                              UserName
----------                ------------                              --------
4/8/2015 9:41:10 AM       arn:aws:iam::123456789012:mfa/David       David
```

- For API details, see ListMfaDevices in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListOpenIdConnectProviders` with a CLI

The following code examples show how to use `ListOpenIdConnectProviders`.

CLI

AWS CLI

To list information about the OpenID Connect providers in the AWS account

This example returns a list of ARNS of all the OpenID Connect providers that are defined in the current AWS account.

```
aws iam list-open-id-connect-providers
```

Output:

```
{
    "OpenIDConnectProviderList": [
        {
            "Arn": "arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com"
        }
    ]
}
```

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see ListOpenIdConnectProviders in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns a list of ARNS of all the OpenID Connect providers that are defined in the current AWS account.

```
Get-IAMOpenIDConnectProviderList
```

Output:

```
Arn
---
arn:aws:iam::123456789012:oidc-provider/server.example.com
arn:aws:iam::123456789012:oidc-provider/another.provider.com
```

- For API details, see ListOpenIdConnectProviders in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns a list of ARNS of all the OpenID Connect providers that are defined in the current AWS account.

```
Get-IAMOpenIDConnectProviderList
```

Output:

```
Arn
---
arn:aws:iam::123456789012:oidc-provider/server.example.com
arn:aws:iam::123456789012:oidc-provider/another.provider.com
```

- For API details, see ListOpenIdConnectProviders in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListPolicies` with an AWS SDK or CLI

The following code examples show how to use `ListPolicies`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage policies

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// List IAM policies.
    /// </summary>
    /// <returns>A list of the IAM policies.</returns>

                    }
                    policyList.append(MyPolicyRecord(name: name, id: id, arn:
arn))
                }
            }
        } catch {
            print("ERROR: listPolicies:", dump(error))
            throw error
        }

        return policyList
    }
```

- For API details, see ListPolicies in *AWS SDK for Swift API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListPolicyVersions` with an AWS SDK or CLI

The following code examples show how to use `ListPolicyVersions`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Manage policies

- Roll back a policy version

CLI

AWS CLI

To list information about the versions of the specified managed policy

This example returns the list of available versions of the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam list-policy-versions \
    --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Output:

```
{
    "IsTruncated": false,
    "Versions": [
        {
        "VersionId": "v2",
        "IsDefaultVersion": true,
        "CreateDate": "2015-06-02T23:19:44Z"
        },
        {
        "VersionId": "v1",
        "IsDefaultVersion": false,
        "CreateDate": "2015-06-02T22:30:47Z"
        }
    ]
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListPolicyVersions in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns the list of available versions of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyManagedPolicy`. To get the policy

document for a specific version, use the `Get-IAMPolicyVersion` command and specify the `VersionId` of the one you want.

```
Get-IAMPolicyVersionList -PolicyArn arn:aws:iam::123456789012:policy/
MyManagedPolicy
```

Output:

```
CreateDate                  Document                IsDefaultVersion
       VersionId
----------                  --------                ---------------
       ---------
2/12/2015 9:39:53 AM                                True
       v2
2/12/2015 9:39:09 AM                                False
       v1
```

- For API details, see ListPolicyVersions in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns the list of available versions of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyManagedPolicy`. To get the policy document for a specific version, use the `Get-IAMPolicyVersion` command and specify the `VersionId` of the one you want.

```
Get-IAMPolicyVersionList -PolicyArn arn:aws:iam::123456789012:policy/
MyManagedPolicy
```

Output:

```
CreateDate                  Document                IsDefaultVersion
       VersionId
----------                  --------                ---------------
       ---------
2/12/2015 9:39:53 AM                                True
       v2
2/12/2015 9:39:09 AM                                False
       v1
```

- For API details, see ListPolicyVersions in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

SAP ABAP

SDK for SAP ABAP

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
TRY.
    oo_result = lo_iam->listpolicyversions(
      iv_policyarn = iv_policy_arn ).
    MESSAGE 'Retrieved policy versions list.' TYPE 'I'.
  CATCH /aws1/cx_iamnosuchentityex.
    MESSAGE 'Policy does not exist.' TYPE 'E'.
  CATCH /aws1/cx_iamservicefailureex.
    MESSAGE 'Service failure when listing policy versions.' TYPE 'E'.
ENDTRY.
```

- For API details, see ListPolicyVersions in *AWS SDK for SAP ABAP API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListRolePolicies` with an AWS SDK or CLI

The following code examples show how to use `ListRolePolicies`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Getting started with internet of things device protection

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// List IAM role policies.
    /// </summary>
    /// <param name="roleName">The IAM role for which to list IAM policies.</
param>
    /// <returns>A list of IAM policy names.</returns>
    public async Task<List<string>> ListRolePoliciesAsync(string roleName)
    {
        var listRolePoliciesPaginator =
 _IAMService.Paginators.ListRolePolicies(new ListRolePoliciesRequest { RoleName =
 roleName });
        var policyNames = new List<string>();

        await foreach (var response in listRolePoliciesPaginator.Responses)
        {
            policyNames.AddRange(response.PolicyNames);
        }

        return policyNames;
    }
```

- For API details, see ListRolePolicies in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To list the policies attached to an IAM role

The following `list-role-policies` command lists the names of the permissions policies for the specified IAM role.

```
aws iam list-role-policies \
    --role-name Test-Role
```

Output:

```
{
    "PolicyNames": [
        "ExamplePolicy"
    ]
}
```

To see the trust policy attached to a role, use the `get-role` command. To see the details of a permissions policy, use the `get-role-policy` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see ListRolePolicies in *AWS CLI Command Reference*.

Go

SDK for Go V2

Use `ListRoleTags` with a CLI

The following code examples show how to use `ListRoleTags`.

CLI

AWS CLI

To list the tags attached to a role

The following `list-role-tags` command retrieves the list of tags associated with the specified role.

```
aws iam list-role-tags \
    --role-name production-role
```

Output:

```
{
    "Tags": [
        {
```

```
            "Key": "Department",
            "Value": "Accounting"
        },
        {
            "Key": "DeptID",
            "Value": "12345"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListRoleTags in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example fetches the tag associated with the role..

```
Get-IAMRoleTagList -RoleName MyRoleName
```

- For API details, see ListRoleTags in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example fetches the tag associated with the role..

```
Get-IAMRoleTagList -RoleName MyRoleName
```

- For API details, see ListRoleTags in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListRoles` with an AWS SDK or CLI

The following code examples show how to use `ListRoles`.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// List IAM roles.
    /// </summary>
    /// <returns>A list of IAM roles.</returns>
    public async Task<List<Role>> ListRolesAsync()
    {
        var listRolesPaginator = _IAMService.Paginators.ListRoles(new
ListRolesRequest());
        var roles = new List<Role>();

        await foreach (var response in listRolesPaginator.Responses)
        {
            roles.AddRange(response.Roles);
        }

        return roles;
    }
```

- For API details, see ListRoles in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To list IAM roles for the current account

The following `list-roles` command lists IAM roles for the current account.

```
aws iam list-roles
```

Output:

```
{
    "Roles": [
        {
            "Path": "/",
            "RoleName": "ExampleRole",

Use `ListSAMLProviders` with an AWS SDK or CLI

The following code examples show how to use `ListSAMLProviders`.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// List SAML authentication providers.
    /// </summary>
    /// <returns>A list of SAML providers.</returns>
    public async Task<List<SAMLProviderListEntry>> ListSAMLProvidersAsync()
    {
        var response = await _IAMService.ListSAMLProvidersAsync(new
ListSAMLProvidersRequest());
        return response.SAMLProviderList;
    }
```

- For API details, see ListSAMLProviders in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To list the SAML providers in the AWS account

This example retrieves the list of SAML 2.0 providers created in the current AWS account.

```
aws iam list-saml-providers
```

Output:

```
{
    "SAMLProviderList": [
        {
            "Arn": "arn:aws:iam::123456789012:saml-provider/SAML-ADFS",
            "ValidUntil": "2015-06-05T22:45:14Z",
            "CreateDate": "2015-06-05T22:45:14Z"
        }
    ]
}
```

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see ListSAMLProviders in *AWS CLI Command Reference*.

Go

SDK for Go V2

> **Note**
>

Use `ListSigningCertificates` with a CLI

The following code examples show how to use `ListSigningCertificates`.

CLI

AWS CLI

To list the signing certificates for an IAM user

The following `list-signing-certificates` command lists the signing certificates for the IAM user named Bob.

```
aws iam list-signing-certificates \
    --user-name Bob
```

Output:

```
{
    "Certificates": [
        {
            "UserName": "Bob",
            "Status": "Inactive",
            "CertificateBody": "-----BEGIN CERTIFICATE-----<certificate-
body>-----END CERTIFICATE-----",
            "CertificateId": "TA7SMP42TDN5Z26OBPJE7EXAMPLE",
            "UploadDate": "2013-06-06T21:40:08Z"
        }
    ]
}
```

For more information, see Manage signing certificates in the *Amazon EC2 User Guide*.

- For API details, see ListSigningCertificates in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves details about the signing certificate that is associated with the user named Bob.

```
Get-IAMSigningCertificate -UserName Bob
```

Output:

Use `ListUserPolicies` with an AWS SDK or CLI

The following code examples show how to use `ListUserPolicies`.

CLI

AWS CLI

To list policies for an IAM user

The following `list-user-policies` command lists the policies that are attached to the IAM user named Bob.

```
aws iam list-user-policies \
    --user-name Bob
```

Output:

```
{
    "PolicyNames": [
        "ExamplePolicy",
        "TestPolicy"
    ]
}
```

For more information, see Creating an IAM user in your AWS account in the *AWS IAM User Guide*.

- For API details, see ListUserPolicies in *AWS CLI Command Reference*.

Go

SDK for Go V2

> **Note**
>

 "github.com/aws/smithy-go"
)

// UserWrapper encapsulates user actions used in the examples.
// It contains an IAM service client that is used to perform user actions.
type UserWrapper struct {
 IamClient *iam.Client
}

// ListUserPolicies lists the inline policies for the specified user.
func (wrapper UserWrapper) ListUserPolicies(ctx context.Context, userName string)
 ([]string, error) {
 var policies []string
 result, err := wrapper.IamClient.ListUserPolicies(ctx,
 &iam.ListUserPoliciesInput{
  UserName: aws.String(userName),
 })
 if err != nil {
  log.Printf("Couldn't list policies for user %v. Here's why: %v\n", userName,
 err)
```

```
 } else {
  policies = result.PolicyNames
 }
 return policies, err
}
```

- For API details, see ListUserPolicies in *AWS SDK for Go API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves the list of names of the inline policies that are embedded in the IAM user named `David`.

```
Get-IAMUserPolicyList -UserName David
```

Output:

```
Davids_IAM_Admin_Policy
```

- For API details, see ListUserPolicies in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example retrieves the list of names of the inline policies that are embedded in the IAM user named `David`.

```
Get-IAMUserPolicyList -UserName David
```

Output:

```
Davids_IAM_Admin_Policy
```

- For API details, see ListUserPolicies in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListUserTags` with a CLI

The following code examples show how to use `ListUserTags`.

CLI

AWS CLI

To list the tags attached to a user

The following `list-user-tags` command retrieves the list of tags associated with the specified IAM user.

```
aws iam list-user-tags \
    --user-name alice
```

Output:

```
{
    "Tags": [
        {
            "Key": "Department",
            "Value": "Accounting"
        },
        {
            "Key": "DeptID",
            "Value": "12345"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListUserTags in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example fetches the tag associated with the user.

```
Get-IAMUserTagList -UserName joe
```

- For API details, see ListUserTags in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example fetches the tag associated with the user.

```
Get-IAMUserTagList -UserName joe
```

- For API details, see ListUserTags in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListUsers` with an AWS SDK or CLI

The following code examples show how to use `ListUsers`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Create read-only and read-write users

Use `ListVirtualMfaDevices` with a CLI

The following code examples show how to use `ListVirtualMfaDevices`.

CLI

AWS CLI

To list virtual MFA devices

The following `list-virtual-mfa-devices` command lists the virtual MFA devices that have been configured for the current account.

```
aws iam list-virtual-mfa-devices
```

Output:

```
{
    "VirtualMFADevices": [
        {
            "SerialNumber": "arn:aws:iam::123456789012:mfa/ExampleMFADevice"
        },
        {
            "SerialNumber": "arn:aws:iam::123456789012:mfa/Fred"
        }
    ]
}
```

For more information, see Enabling a virtual multi-factor authentication (MFA) device in the *AWS IAM User Guide*.

- For API details, see ListVirtualMfaDevices in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves a collection of the virtual MFA devices that are assigned to users in the AWS account. The `User` property of each is an object with details of the IAM user to which the device is assigned.

```
Get-IAMVirtualMFADevice -AssignmentStatus Assigned
```

Output:

```
Base32StringSeed :
EnableDate       : 4/13/2015 12:03:42 PM
QRCodePNG        :
SerialNumber     : arn:aws:iam::123456789012:mfa/David
User             : Amazon.IdentityManagement.Model.User

Base32StringSeed :
EnableDate       : 4/13/2015 12:06:41 PM
QRCodePNG        :
SerialNumber     : arn:aws:iam::123456789012:mfa/root-account-mfa-device
User             : Amazon.IdentityManagement.Model.User
```

- For API details, see ListVirtualMfaDevices in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example retrieves a collection of the virtual MFA devices that are assigned to users in the AWS account. The `User` property of each is an object with details of the IAM user to which the device is assigned.

```
Get-IAMVirtualMFADevice -AssignmentStatus Assigned
```

Output:

```

```

```
User             : Amazon.IdentityManagement.Model.User

Base32StringSeed :
EnableDate       : 4/13/2015 12:06:41 PM
QRCodePNG        :
SerialNumber     : arn:aws:iam::123456789012:mfa/root-account-mfa-device
User             : Amazon.IdentityManagement.Model.User
```

- For API details, see ListVirtualMfaDevices in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `PutGroupPolicy` with a CLI

The following code examples show how to use `PutGroupPolicy`.

CLI

AWS CLI

To add a policy to a group

The following `put-group-policy` command adds a policy to the IAM group named `Admins`.

```
aws iam put-group-policy \
    --group-name Admins \
    --policy-document file://AdminPolicy.json \
    --policy-name AdminRoot
```

This command produces no output.

The policy is defined as a JSON document in the *AdminPolicy.json* file. (The file name and extension do not have significance.)

For more information, see Managing IAM policies in the *AWS IAM User Guide*.

- For API details, see PutGroupPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates an inline policy named `AppTesterPolicy` and embeds it in the IAM group `AppTesters`. If an inline policy with the same name already exists, then it is overwritten. The JSON policy content comes the file `apptesterpolicy.json`. Note that you must use the `-Raw` parameter to successfully process the content of the JSON file.

```
Write-IAMGroupPolicy -GroupName AppTesters -PolicyName AppTesterPolicy -
PolicyDocument (Get-Content -Raw apptesterpolicy.json)
```

- For API details, see PutGroupPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates an inline policy named `AppTesterPolicy` and embeds it in the IAM group `AppTesters`. If an inline policy with the same name already exists, then it is overwritten. The JSON policy content comes the file `apptesterpolicy.json`. Note that you must use the `-Raw` parameter to successfully process the content of the JSON file.

```
Write-IAMGroupPolicy -GroupName AppTesters -PolicyName AppTesterPolicy -
PolicyDocument (Get-Content -Raw apptesterpolicy.json)
```

- For API details, see PutGroupPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `PutRolePermissionsBoundary` with a CLI

The following code examples show how to use `PutRolePermissionsBoundary`.

CLI

AWS CLI

Example 1: To apply a permissions boundary based on a custom policy to an IAM role

The following `put-role-permissions-boundary` example applies the custom policy named `intern-boundary` as the permissions boundary for the specified IAM role.

```
aws iam put-role-permissions-boundary \
    --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \
    --role-name lambda-application-role
```

This command produces no output.

Example 2: To apply a permissions boundary based on an AWS managed policy to an IAM role

The following `put-role-permissions-boundary` example applies the AWS managed `PowerUserAccess` policy as the permissions boundary for the specified IAM role.

```
aws iam put-role-permissions-boundary \
    --permissions-boundary arn:aws:iam::aws:policy/PowerUserAccess \
    --role-name x-account-admin
```

This command produces no output.

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see PutRolePermissionsBoundary in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example shows how to set the Permission boundary for a IAM Role. You can set AWS Managed policies or Custom policies as permission boundary.

```
Set-IAMRolePermissionsBoundary -RoleName MyRoleName -PermissionsBoundary
 arn:aws:iam::123456789012:policy/intern-boundary
```

- For API details, see PutRolePermissionsBoundary in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example shows how to set the Permission boundary for a IAM Role. You can set AWS Managed policies or Custom policies as permission boundary.

```
Set-IAMRolePermissionsBoundary -RoleName MyRoleName -PermissionsBoundary
 arn:aws:iam::123456789012:policy/intern-boundary
```

- For API details, see PutRolePermissionsBoundary in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `PutRolePolicy` with an AWS SDK or CLI

The following code examples show how to use `PutRolePolicy`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Get started with serverless data warehouses
- Getting started with configuration management
- Getting started with internet of things device protection
- Getting started with provisioned data warehouse clusters
- Run CPU stress tests on virtual machine instances using fault injection

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Update the inline policy document embedded in a role.
    /// </summary>
    /// <param name="policyName">The name of the policy to embed.</param>
```

```
    /// <param name="roleName">The name of the role to update.</param>
    /// <param name="policyDocument">The policy document that defines the role.</
param>
    /// <returns>A Boolean value indicating the success of the action.</returns>
    public async Task<bool> PutRolePolicyAsync(string policyName, string
 roleName, string policyDocument)
    {
        var request = new PutRolePolicyRequest
        {
            PolicyName = policyName,
            RoleName = roleName,
            PolicyDocument = policyDocument
        };

        var response = await _IAMService.PutRolePolicyAsync(request);
        return response.HttpStatusCode == HttpStatusCode.OK;
    }
```

- For API details, see PutRolePolicy in *AWS SDK for .NET API Reference*.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::putRolePolicy(
        const Aws::String &roleName,
        const Aws::String &policyName,
        const Aws::String &policyDocument,
        const Aws::Client::ClientConfiguration &clientConfig) {
    Aws::IAM::IAMClient iamClient(clientConfig);
    Aws::IAM::Model::PutRolePolicyRequest request;

    request.SetRoleName(roleName);
    request.SetPolicyName(policyName);
```

```
    request.SetPolicyDocument(policyDocument);

    Aws::IAM::Model::PutRolePolicyOutcome outcome =
 iamClient.PutRolePolicy(request);
    if (!outcome.IsSuccess()) {
        std::cerr << "Error putting policy on role. " <<
                  outcome.GetError().GetMessage() << std::endl;
    }
    else {
        std::cout << "Successfully put the role policy." << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see PutRolePolicy in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To attach a permissions policy to an IAM role

The following `put-role-policy` command adds a permissions policy to the role named `Test-Role`.

```
aws iam put-role-policy \
    --role-name Test-Role \
    --policy-name ExamplePolicy \
    --policy-document file://AdminPolicy.json
```

This command produces no output.

The policy is defined as a JSON document in the *AdminPolicy.json* file. (The file name and extension do not have significance.)

To attach a trust policy to a role, use the `update-assume-role-policy` command.

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see PutRolePolicy in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**

Use `PutUserPermissionsBoundary` with a CLI

The following code examples show how to use `PutUserPermissionsBoundary`.

CLI

AWS CLI

Example 1: To apply a permissions boundary based on a custom policy to an IAM user

The following `put-user-permissions-boundary` example applies a custom policy named `intern-boundary` as the permissions boundary for the specified IAM user.

```
aws iam put-user-permissions-boundary \
    --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \
    --user-name intern
```

This command produces no output.

Example 2: To apply a permissions boundary based on an AWS managed policy to an IAM user

The following `put-user-permissions-boundary` example applies the AWS managed pollicy named `PowerUserAccess` as the permissions boundary for the specified IAM user.

```
aws iam put-user-permissions-boundary \
    --permissions-boundary arn:aws:iam::aws:policy/PowerUserAccess \
    --user-name developer
```

This command produces no output.

For more information, see Adding and removing IAM identity permissions in the *AWS IAM User Guide*.

- For API details, see PutUserPermissionsBoundary in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example shows how to set the Permission boundary for the user. You can set AWS Managed policies or Custom policies as permission boundary.

```
Set-IAMUserPermissionsBoundary -UserName joe -PermissionsBoundary
 arn:aws:iam::123456789012:policy/intern-boundary
```

- For API details, see PutUserPermissionsBoundary in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example shows how to set the Permission boundary for the user. You can set AWS Managed policies or Custom policies as permission boundary.

```
Set-IAMUserPermissionsBoundary -UserName joe -PermissionsBoundary
 arn:aws:iam::123456789012:policy/intern-boundary
```

- For API details, see PutUserPermissionsBoundary in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Use `PutUserPolicy` with an AWS SDK or CLI

The following code examples show how to use `PutUserPolicy`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

CLI

AWS CLI

To attach a policy to an IAM user

The following `put-user-policy` command attaches a policy to the IAM user named Bob.

```
aws iam put-user-policy \
    --user-name Bob \
    --policy-name ExamplePolicy \
    --policy-document file://AdminPolicy.json
```

This command produces no output.

The policy is defined as a JSON document in the *AdminPolicy.json* file. (The file name and extension do not have significance.)

For more information, see Adding and removing IAM identity permissions in the *AWS IAM User Guide*.

- For API details, see PutUserPolicy in *AWS CLI Command Reference*.

Go

SDK for Go V2

> **Note**
>

}
```

- For API details, see PutUserPolicy in *AWS SDK for Go API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates an inline policy named EC2AccessPolicy and embeds it in the IAM user Bob. If an inline policy with the same name already exists, then it is overwritten. The JSON policy content comes from the file EC2AccessPolicy.json. Note that you must use the -Raw parameter to successfully process the content of the JSON file.

```
Write-IAMUserPolicy -UserName Bob -PolicyName EC2AccessPolicy -PolicyDocument
 (Get-Content -Raw EC2AccessPolicy.json)
```

- For API details, see PutUserPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates an inline policy named EC2AccessPolicy and embeds it in the IAM user Bob. If an inline policy with the same name already exists, then it is overwritten. The JSON policy content comes from the file EC2AccessPolicy.json. Note that you must use the -Raw parameter to successfully process the content of the JSON file.

```
Write-IAMUserPolicy -UserName Bob -PolicyName EC2AccessPolicy -PolicyDocument
 (Get-Content -Raw EC2AccessPolicy.json)
```

- For API details, see PutUserPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Ruby

Swift

SDK for Swift

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import AWSIAM
import AWSS3

    func putUserPolicy(policyDocument: String, policyName: String, user:
 IAMClientTypes.User) async throws {
        let input = PutUserPolicyInput(
            policyDocument: policyDocument,
            policyName: policyName,
            userName: user.userName
        )
        do {
            _ = try await iamClient.putUserPolicy(input: input)
        } catch {
            print("ERROR: putUserPolicy:", dump(error))
            throw error
        }
    }
```

- For API details, see PutUserPolicy in *AWS SDK for Swift API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `RemoveClientIdFromOpenIdConnectProvider` with a CLI

The following code examples show how to use `RemoveClientIdFromOpenIdConnectProvider`.

CLI

AWS CLI

To remove the specified client ID from the list of client IDs registered for the specified IAM OpenID Connect provider

This example removes the client ID `My-TestApp-3` from the list of client IDs associated with the IAM OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com`.

```
aws iam remove-client-id-from-open-id-connect-provider
    --client-id My-TestApp-3 \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com
```

This command produces no output.

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see RemoveClientIdFromOpenIdConnectProvider in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example removes the client ID `My-TestApp-3` from the list of client IDs associated with the IAM OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com`.

```
Remove-IAMClientIDFromOpenIDConnectProvider -ClientID My-TestApp-3
 -OpenIDConnectProviderArn arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com
```

- For API details, see RemoveClientIdFromOpenIdConnectProvider in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example removes the client ID `My-TestApp-3` from the list of client IDs associated with the IAM OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com`.

```
Remove-IAMClientIDFromOpenIDConnectProvider -ClientID My-TestApp-3
 -OpenIDConnectProviderArn arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com
```

- For API details, see RemoveClientIdFromOpenIdConnectProvider in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `RemoveRoleFromInstanceProfile` with a CLI

The following code examples show how to use `RemoveRoleFromInstanceProfile`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Getting started with managed streaming
- Run CPU stress tests on virtual machine instances using fault injection

CLI

AWS CLI

To remove a role from an instance profile

The following `remove-role-from-instance-profile` command removes the role named `Test-Role` from the instance profile named `ExampleInstanceProfile`.

```
aws iam remove-role-from-instance-profile \
    --instance-profile-name ExampleInstanceProfile \
    --role-name Test-Role
```

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see RemoveRoleFromInstanceProfile in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the role named `MyNewRole` from the EC2 instance profile named `MyNewRole`. An instance profile that is created in the IAM console always has the same name as the role, as in this example. If you create them in the API or CLI, then they can have different names.

```
Remove-IAMRoleFromInstanceProfile -InstanceProfileName MyNewRole -RoleName
 MyNewRole -Force
```

- For API details, see RemoveRoleFromInstanceProfile in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the role named `MyNewRole` from the EC2 instance profile named `MyNewRole`. An instance profile that is created in the IAM console always has the same name as the role, as in this example. If you create them in the API or CLI, then they can have different names.

```
Remove-IAMRoleFromInstanceProfile -InstanceProfileName MyNewRole -RoleName
 MyNewRole -Force
```

- For API details, see RemoveRoleFromInstanceProfile in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `RemoveUserFromGroup` with a CLI

The following code examples show how to use `RemoveUserFromGroup`.

CLI

AWS CLI

To remove a user from an IAM group

The following `remove-user-from-group` command removes the user named Bob from the IAM group named `Admins`.

```
aws iam remove-user-from-group \
    --user-name Bob \
    --group-name Admins
```

This command produces no output.

For more information, see Adding and removing users in an IAM user group in the *AWS IAM User Guide*.

- For API details, see RemoveUserFromGroup in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example removes the IAM user Bob from the group `Testers`.

```
Remove-IAMUserFromGroup -GroupName Testers -UserName Bob
```

Example 2: This example finds any groups of which IAM user `Theresa` is a member, and then removes `Theresa` from those groups.

```
$groups = Get-IAMGroupForUser -UserName Theresa
foreach ($group in $groups) { Remove-IAMUserFromGroup -GroupName $group.GroupName
 -UserName Theresa -Force }
```

Example 3: This example shows an alternate way of removing the IAM user Bob from the `Testers` group.

```
Get-IAMGroupForUser -UserName Bob | Remove-IAMUserFromGroup -UserName Bob -
GroupName Testers -Force
```

- For API details, see RemoveUserFromGroup in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example removes the IAM user Bob from the group `Testers`.

```
Remove-IAMUserFromGroup -GroupName Testers -UserName Bob
```

Example 2: This example finds any groups of which IAM user `Theresa` is a member, and then removes `Theresa` from those groups.

```
$groups = Get-IAMGroupForUser -UserName Theresa
foreach ($group in $groups) { Remove-IAMUserFromGroup -GroupName $group.GroupName
 -UserName Theresa -Force }
```

Example 3: This example shows an alternate way of removing the IAM user Bob from the `Testers` group.

```
Get-IAMGroupForUser -UserName Bob | Remove-IAMUserFromGroup -UserName Bob -
GroupName Testers -Force
```

- For API details, see RemoveUserFromGroup in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ResyncMfaDevice` with a CLI

The following code examples show how to use `ResyncMfaDevice`.

CLI

AWS CLI

To synchronize an MFA device

The following `resync-mfa-device` example synchronizes the MFA device that is associated with the IAM user Bob and whose ARN is `arn:aws:iam::123456789012:mfa/`

BobsMFADevice with an authenticator program that provided the two authentication codes.

```
aws iam resync-mfa-device \
    --user-name Bob \
    --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice \
    --authentication-code1 123456 \
    --authentication-code2 987654
```

This command produces no output.

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see ResyncMfaDevice in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example synchronizes the MFA device that is associated with the IAM user Bob and whose ARN is `arn:aws:iam::123456789012:mfa/bob` with an authenticator program that provided the two authentication codes.

```
Sync-IAMMFADevice -SerialNumber arn:aws:iam::123456789012:mfa/theresa -
AuthenticationCode1 123456 -AuthenticationCode2 987654 -UserName Bob
```

Example 2: This example synchronizes the IAM MFA device that is associated with the IAM user Theresa with a physical device that has the serial number ABCD12345678 and that provided the two authentication codes.

```
Sync-IAMMFADevice -SerialNumber ABCD12345678 -AuthenticationCode1 123456 -
AuthenticationCode2 987654 -UserName Theresa
```

- For API details, see ResyncMfaDevice in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example synchronizes the MFA device that is associated with the IAM user Bob and whose ARN is `arn:aws:iam::123456789012:mfa/bob` with an authenticator program that provided the two authentication codes.

```
Sync-IAMMFADevice -SerialNumber arn:aws:iam::123456789012:mfa/theresa -
AuthenticationCode1 123456 -AuthenticationCode2 987654 -UserName Bob
```

Example 2: This example synchronizes the IAM MFA device that is associated with the IAM user Theresa with a physical device that has the serial number ABCD12345678 and that provided the two authentication codes.

```
Sync-IAMMFADevice -SerialNumber ABCD12345678 -AuthenticationCode1 123456 -
AuthenticationCode2 987654 -UserName Theresa
```

- For API details, see ResyncMfaDevice in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `SetDefaultPolicyVersion` with an AWS SDK or CLI

The following code examples show how to use `SetDefaultPolicyVersion`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Manage policies
- Roll back a policy version

CLI

AWS CLI

To set the specified version of the specified policy as the policy's default version.

This example sets the v2 version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` as the default active version.

```
aws iam set-default-policy-version \
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --version-id v2
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see SetDefaultPolicyVersion in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example sets the v2 version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` as the default active version.

```
Set-IAMDefaultPolicyVersion -PolicyArn arn:aws:iam::123456789012:policy/MyPolicy
 -VersionId v2
```

- For API details, see SetDefaultPolicyVersion in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example sets the v2 version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` as the default active version.

```
Set-IAMDefaultPolicyVersion -PolicyArn arn:aws:iam::123456789012:policy/MyPolicy
 -VersionId v2
```

- For API details, see SetDefaultPolicyVersion in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

SAP ABAP

SDK for SAP ABAP

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    TRY.
```

```
        lo_iam->setdefaultpolicyversion(
          iv_policyarn = iv_policy_arn
          iv_versionid = iv_version_id ).
        MESSAGE 'Default policy version set successfully.' TYPE 'I'.
      CATCH /aws1/cx_iamnosuchentityex.
        MESSAGE 'Policy or version does not exist.' TYPE 'E'.
      CATCH /aws1/cx_iaminvalidinputex.
        MESSAGE 'Invalid input provided.' TYPE 'E'.
      CATCH /aws1/cx_iamlimitexceededex.
        MESSAGE 'Limit exceeded.' TYPE 'E'.
    ENDTRY.
```

- For API details, see SetDefaultPolicyVersion in *AWS SDK for SAP ABAP API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `TagRole` with a CLI

The following code examples show how to use `TagRole`.

CLI

AWS CLI

To add a tag to a role

The following `tag-role` command adds a tag with a Department name to the specified role.

```
aws iam tag-role --role-name my-role \
    --tags '{"Key": "Department", "Value": "Accounting"}'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagRole in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example adds tag to Role in Identity Management Service

```
Add-IAMRoleTag -RoleName AdminRoleacess -Tag @{ Key = 'abac'; Value = 'testing'}
```

- For API details, see TagRole in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example adds tag to Role in Identity Management Service

```
Add-IAMRoleTag -RoleName AdminRoleacess -Tag @{ Key = 'abac'; Value = 'testing'}
```

- For API details, see TagRole in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `TagUser` with a CLI

The following code examples show how to use `TagUser`.

CLI

AWS CLI

To add a tag to a user

The following `tag-user` command adds a tag with the associated Department to the specified user.

```
aws iam tag-user \
    --user-name alice \
    --tags '{"Key": "Department", "Value": "Accounting"}'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagUser in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example adds tag to User in Identity Management Service

```
Add-IAMUserTag -UserName joe -Tag @{ Key = 'abac'; Value = 'testing'}
```

- For API details, see TagUser in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example adds tag to User in Identity Management Service

```
Add-IAMUserTag -UserName joe -Tag @{ Key = 'abac'; Value = 'testing'}
```

- For API details, see TagUser in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UntagRole` with a CLI

The following code examples show how to use `UntagRole`.

CLI

AWS CLI

To remove a tag from a role

The following `untag-role` command removes any tag with the key name 'Department' from the specified role.

```
aws iam untag-role \
    --role-name my-role \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagRole in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example removes the tag from the role named "MyRoleName" with tag key as "abac". To remove multiple tags, provide a comma separted tag keys list.

```
Remove-IAMRoleTag -RoleName MyRoleName -TagKey "abac","xyzw"
```

- For API details, see UntagRole in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example removes the tag from the role named "MyRoleName" with tag key as "abac". To remove multiple tags, provide a comma separted tag keys list.

```
Remove-IAMRoleTag -RoleName MyRoleName -TagKey "abac","xyzw"
```

- For API details, see UntagRole in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UntagUser` with a CLI

The following code examples show how to use `UntagUser`.

CLI

AWS CLI

To remove a tag from a user

The following `untag-user` command removes any tag with the key name 'Department' from the specified user.

```
aws iam untag-user \
```

```
    --user-name alice \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagUser in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example removes the tag from the user named "joe" with tag key as "abac" and "xyzw". To remove multiple tags, provide a comma separted tag keys list.

```
Remove-IAMUserTag -UserName joe -TagKey "abac","xyzw"
```

- For API details, see UntagUser in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example removes the tag from the user named "joe" with tag key as "abac" and "xyzw". To remove multiple tags, provide a comma separted tag keys list.

```
Remove-IAMUserTag -UserName joe -TagKey "abac","xyzw"
```

- For API details, see UntagUser in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateAccessKey` with an AWS SDK or CLI

The following code examples show how to use `UpdateAccessKey`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage access keys

Bash

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
##############################################################################
# function iam_update_access_key
#
# This function can activate or deactivate an IAM access key for the specified
 IAM user.
#
# Parameters:
#       -u user_name  -- The name of the user.
#       -k access_key -- The access key to update.
#       -a            -- Activate the selected access key.
#       -d            -- Deactivate the selected access key.
#
# Example:
#       # To deactivate the selected access key for IAM user Bob
#       iam_update_access_key -u Bob -k AKIAIOSFODNN7EXAMPLE -d
#
# Returns:
#       0 - If successful.
#       1 - If it fails.
##############################################################################
function iam_update_access_key() {
  local user_name access_key status response
  local option OPTARG # Required to use getopts command in a function.
  local activate_flag=false deactivate_flag=false

    response=$(aws iam update-access-key \
      --user-name "$user_name" \
      --access-key-id "$access_key" \
      --status "$status" 2>&1)

    local error_code=${?}

    if [[ $error_code -ne 0 ]]; then
      aws_cli_error_log $error_code
      errecho "ERROR: AWS reports update-access-key operation failed.\n$response"
      return 1
    fi

    iecho "update-access-key response: $response"
    iecho

    return 0
}
```

- For API details, see UpdateAccessKey in *AWS CLI Command Reference*.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::updateAccessKey(const Aws::String &userName,
                                  const Aws::String &accessKeyID,
                                  Aws::IAM::Model::StatusType status,
                                  const Aws::Client::ClientConfiguration
 &clientConfig) {
    Aws::IAM::IAMClient iam(clientConfig);
    Aws::IAM::Model::UpdateAccessKeyRequest request;
    request.SetUserName(userName);
    request.SetAccessKeyId(accessKeyID);
    request.SetStatus(status);

    auto outcome = iam.UpdateAccessKey(request);
    if (outcome.IsSuccess()) {
        std::cout << "Successfully updated status of access key "
                  << accessKeyID << " for user " << userName << std::endl;
    }
    else {
        std::cerr << "Error updated status of access key " << accessKeyID <<
                  " for user " << userName << ": " <<
                  outcome.GetError().GetMessage() << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see UpdateAccessKey in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To activate or deactivate an access key for an IAM user

The following `update-access-key` command deactivates the specified access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam update-access-key \
    --access-key-id AKIAIOSFODNN7EXAMPLE \
    --status Inactive \
    --user-name Bob
```

This command produces no output.

Deactivating the key means that it cannot be used for programmatic access to AWS. However, the key is still available and can be reactivated.

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see UpdateAccessKey in *AWS CLI Command Reference*.

Java

SDK for Java 2.x

            System.exit(1);
        }
    }
}
```

- For API details, see UpdateAccessKey in *AWS SDK for Java 2.x API Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Update the access key.

```
import {
  UpdateAccessKeyCommand,
  IAMClient,
  StatusType,
} from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} userName
 * @param {string} accessKeyId
 */
export const updateAccessKey = (userName, accessKeyId) => {
  const command = new UpdateAccessKeyCommand({
    AccessKeyId: accessKeyId,
    Status: StatusType.Inactive,
    UserName: userName,
  });

  return client.send(command);
};
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see UpdateAccessKey in *AWS SDK for JavaScript API Reference*.

SDK for JavaScript (v2)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// Load the AWS SDK for Node.js
var AWS = require("aws-sdk");
// Set the region
AWS.config.update({ region: "REGION" });
```

```
// Create the IAM service object
var iam = new AWS.IAM({ apiVersion: "2010-05-08" });

var params = {
  AccessKeyId: "ACCESS_KEY_ID",
  Status: "Active",
  UserName: "USER_NAME",
};

iam.updateAccessKey(params, function (err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see UpdateAccessKey in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example changes the status of the access key `AKIAIOSFODNN7EXAMPLE` for the IAM user named `Bob` to `Inactive`.

```
Update-IAMAccessKey -UserName Bob -AccessKeyId AKIAIOSFODNN7EXAMPLE -Status
 Inactive
```

- For API details, see UpdateAccessKey in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example changes the status of the access key `AKIAIOSFODNN7EXAMPLE` for the IAM user named `Bob` to `Inactive`.

```
Update-IAMAccessKey -UserName Bob -AccessKeyId AKIAIOSFODNN7EXAMPLE -Status
 Inactive
```

- For API details, see UpdateAccessKey in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
def update_key(user_name, key_id, activate):
    """
    Updates the status of a key.

    :param user_name: The user that owns the key.
    :param key_id: The ID of the key to update.
    :param activate: When True, the key is activated. Otherwise, the key is
 deactivated.
    """

    try:
        key = iam.User(user_name).AccessKey(key_id)
        if activate:
            key.activate()
        else:
            key.deactivate()
        logger.info("%s key %s.", "Activated" if activate else "Deactivated",
 key_id)
    except ClientError:
        logger.exception(
            "Couldn't %s key %s.", "Activate" if activate else "Deactivate",
 key_id
        )
        raise
```

- For API details, see UpdateAccessKey in *AWS SDK for Python (Boto3) API Reference*.

SAP ABAP

SDK for SAP ABAP

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
TRY.
    lo_iam->updateaccesskey(
      iv_accesskeyid = iv_access_key_id
      iv_status = iv_status
      iv_username = iv_user_name ).
    MESSAGE 'Access key updated successfully.' TYPE 'I'.
  CATCH /aws1/cx_iamnosuchentityex.
    MESSAGE 'Access key or user does not exist.' TYPE 'E'.
ENDTRY.
```

- For API details, see UpdateAccessKey in *AWS SDK for SAP ABAP API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateAccountPasswordPolicy` with a CLI

The following code examples show how to use `UpdateAccountPasswordPolicy`.

CLI

AWS CLI

To set or change the current account password policy

The following `update-account-password-policy` command sets the password policy to require a minimum length of eight characters and to require one or more numbers in the password.

```
aws iam update-account-password-policy \
    --minimum-password-length 8 \
    --require-numbers
```

This command produces no output.

Changes to an account's password policy affect any new passwords that are created for IAM users in the account. Password policy changes do not affect existing passwords.

For more information, see Setting an account password policy for IAM users in the *AWS IAM User Guide*.

- For API details, see UpdateAccountPasswordPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates the password policy for the account with the specified settings. Note that any parameters that are not included in the command are not left unmodified. Instead, they are reset to default values.

```
Update-IAMAccountPasswordPolicy -AllowUsersToChangePasswords $true -HardExpiry
 $false -MaxPasswordAge 90 -MinimumPasswordLength 8 -PasswordReusePrevention 20
 -RequireLowercaseCharacters $true -RequireNumbers $true -RequireSymbols $true -
RequireUppercaseCharacters $true
```

- For API details, see UpdateAccountPasswordPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates the password policy for the account with the specified settings. Note that any parameters that are not included in the command are not left unmodified. Instead, they are reset to default values.

```
Update-IAMAccountPasswordPolicy -AllowUsersToChangePasswords $true -HardExpiry
 $false -MaxPasswordAge 90 -MinimumPasswordLength 8 -PasswordReusePrevention 20
 -RequireLowercaseCharacters $true -RequireNumbers $true -RequireSymbols $true -
RequireUppercaseCharacters $true
```

- For API details, see UpdateAccountPasswordPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateAssumeRolePolicy` with a CLI

The following code examples show how to use `UpdateAssumeRolePolicy`.

CLI

AWS CLI

To update the trust policy for an IAM role

The following `update-assume-role-policy` command updates the trust policy for the role named `Test-Role`.

```
aws iam update-assume-role-policy \
    --role-name Test-Role \
    --policy-document file://Test-Role-Trust-Policy.json
```

This command produces no output.

The trust policy is defined as a JSON document in the *Test-Role-Trust-Policy.json* file. (The file name and extension do not have significance.) The trust policy must specify a principal.

To update the permissions policy for a role, use the `put-role-policy` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see UpdateAssumeRolePolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates the IAM role named `ClientRole` with a new trust policy, the contents of which come from the file `ClientRolePolicy.json`. Note that

you must use the `-Raw` switch parameter to successfully process the contents of the JSON file.

```
Update-IAMAssumeRolePolicy -RoleName ClientRole -PolicyDocument (Get-Content -raw
 ClientRolePolicy.json)
```

- For API details, see UpdateAssumeRolePolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates the IAM role named `ClientRole` with a new trust policy, the contents of which come from the file `ClientRolePolicy.json`. Note that you must use the `-Raw` switch parameter to successfully process the contents of the JSON file.

```
Update-IAMAssumeRolePolicy -RoleName ClientRole -PolicyDocument (Get-Content -raw
 ClientRolePolicy.json)
```

- For API details, see UpdateAssumeRolePolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateGroup` with a CLI

The following code examples show how to use `UpdateGroup`.

CLI

AWS CLI

To rename an IAM group

The following `update-group` command changes the name of the IAM group `Test` to `Test-1`.

```
aws iam update-group \
```

```
    --group-name Test \
    --new-group-name Test-1
```

This command produces no output.

For more information, see Renaming an IAM user group in the *AWS IAM User Guide*.

- For API details, see UpdateGroup in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example renames the IAM group `Testers` to `AppTesters`.

```
Update-IAMGroup -GroupName Testers -NewGroupName AppTesters
```

Example 2: This example changes the path of the IAM group `AppTesters` to `/Org1/Org2/`. This changes the ARN for the group to `arn:aws:iam::123456789012:group/Org1/Org2/AppTesters`.

```
Update-IAMGroup -GroupName AppTesters -NewPath /Org1/Org2/
```

- For API details, see UpdateGroup in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example renames the IAM group `Testers` to `AppTesters`.

```
Update-IAMGroup -GroupName Testers -NewGroupName AppTesters
```

Example 2: This example changes the path of the IAM group `AppTesters` to `/Org1/Org2/`. This changes the ARN for the group to `arn:aws:iam::123456789012:group/Org1/Org2/AppTesters`.

```
Update-IAMGroup -GroupName AppTesters -NewPath /Org1/Org2/
```

- For API details, see UpdateGroup in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateLoginProfile` with a CLI

The following code examples show how to use `UpdateLoginProfile`.

CLI

AWS CLI

To update the password for an IAM user

The following `update-login-profile` command creates a new password for the IAM user named Bob.

```
aws iam update-login-profile \
    --user-name Bob \
    --password <password>
```

This command produces no output.

To set a password policy for the account, use the `update-account-password-policy` command. If the new password violates the account password policy, the command returns a `PasswordPolicyViolation` error.

If the account password policy allows them to, IAM users can change their own passwords using the `change-password` command.

Store the password in a secure place. If the password is lost, it cannot be recovered, and you must create a new one using the `create-login-profile` command.

For more information, see Managing passwords for IAM users in the *AWS IAM User Guide*.

- For API details, see UpdateLoginProfile in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example sets a new temporary password for the IAM user Bob, and requires the user to change the password the next time the user signs in.

```
Update-IAMLoginProfile -UserName Bob -Password "P@ssw0rd1234" -
PasswordResetRequired $true
```

- For API details, see UpdateLoginProfile in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example sets a new temporary password for the IAM user Bob, and requires the user to change the password the next time the user signs in.

```
Update-IAMLoginProfile -UserName Bob -Password "P@ssw0rd1234" -
PasswordResetRequired $true
```

- For API details, see UpdateLoginProfile in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateOpenIdConnectProviderThumbprint` with a CLI

The following code examples show how to use `UpdateOpenIdConnectProviderThumbprint`.

CLI

AWS CLI

To replace the existing list of server certificate thumbprints with a new list

This example updates the certificate thumbprint list for the OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com` to use a new thumbprint.

```
aws iam update-open-id-connect-provider-thumbprint \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com \
    --thumbprint-list 7359755EXAMPLEabc3060bce3EXAMPLEec4542a3
```

If your OIDC provider's discovery and JWKS endpoints use different certificates, include thumbprints for both endpoints in the `--thumbprint-list` value.

This command produces no output.

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see UpdateOpenIdConnectProviderThumbprint in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates the certificate thumbprint list for the OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com` to use a new thumbprint. The OIDC provider shares the new value when the certificate that is associated with the provider changes.

```
Update-IAMOpenIDConnectProviderThumbprint -OpenIDConnectProviderArn
 arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com -ThumbprintList
 7359755EXAMPLEabc3060bce3EXAMPLEec4542a3
```

- For API details, see UpdateOpenIdConnectProviderThumbprint in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates the certificate thumbprint list for the OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com` to use a new thumbprint. The OIDC provider shares the new value when the certificate that is associated with the provider changes.

```
Update-IAMOpenIDConnectProviderThumbprint -OpenIDConnectProviderArn
 arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com -ThumbprintList
 7359755EXAMPLEabc3060bce3EXAMPLEec4542a3
```

- For API details, see UpdateOpenIdConnectProviderThumbprint in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateRole` with a CLI

The following code examples show how to use `UpdateRole`.

CLI

AWS CLI

To change an IAM role's description or session duration

The following `update-role` command changes the description of the IAM role `production-role` to `Main production role` and sets the maximum session duration to 12 hours.

```
aws iam update-role \
    --role-name production-role \
    --description 'Main production role' \
    --max-session-duration 43200
```

This command produces no output.

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see UpdateRole in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates the role description and the maximum session duration value(in seconds) for which a role's session can be requested.

```
Update-IAMRole -RoleName MyRoleName -Description "My testing role" -
MaxSessionDuration 43200
```

- For API details, see UpdateRole in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates the role description and the maximum session duration value(in seconds) for which a role's session can be requested.

```
Update-IAMRole -RoleName MyRoleName -Description "My testing role" -
MaxSessionDuration 43200
```

- For API details, see UpdateRole in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateRoleDescription` with a CLI

The following code examples show how to use `UpdateRoleDescription`.

CLI

AWS CLI

To change an IAM role's description

The following `update-role` command changes the description of the IAM role `production-role` to `Main production role`.

```
aws iam update-role-description \
    --role-name production-role \
    --description 'Main production role'
```

Output:

```
{
    "Role": {
        "Path": "/",
        "RoleName": "production-role",
        "RoleId": "AROA1234567890EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:role/production-role",
        "CreateDate": "2017-12-06T17:16:37+00:00",
        "AssumeRolePolicyDocument": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Effect": "Allow",
                    "Principal": {
```

```
                        "AWS": "arn:aws:iam::123456789012:root"
                    },
                    "Action": "sts:AssumeRole",
                    "Condition": {}
                }
            ]
        },
        "Description": "Main production role"
    }
}
```

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see UpdateRoleDescription in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates the description of an IAM role in your account.

```
Update-IAMRoleDescription -RoleName MyRoleName -Description "My testing role"
```

- For API details, see UpdateRoleDescription in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates the description of an IAM role in your account.

```
Update-IAMRoleDescription -RoleName MyRoleName -Description "My testing role"
```

- For API details, see UpdateRoleDescription in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateSamlProvider` with a CLI

The following code examples show how to use `UpdateSamlProvider`.

CLI

AWS CLI

To update the metadata document for an existing SAML provider

This example updates the SAML provider in IAM whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFS` with a new SAML metadata document from the file `SAMLMetaData.xml`.

```
aws iam update-saml-provider \
    --saml-metadata-document file://SAMLMetaData.xml \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFS
```

Output:

```
{
    "SAMLProviderArn": "arn:aws:iam::123456789012:saml-provider/SAMLADFS"
}
```

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see UpdateSamlProvider in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates the SAML provider in IAM whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFS` with a new SAML metadata document from the file `SAMLMetaData.xml`. Note that you must use the `-Raw` switch parameter to successfully process the contents of the JSON file.

```
Update-IAMSAMLProvider -SAMLProviderArn arn:aws:iam::123456789012:saml-provider/
SAMLADFS -SAMLMetadataDocument (Get-Content -Raw SAMLMetaData.xml)
```

- For API details, see UpdateSamlProvider in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates the SAML provider in IAM whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFS` with a new SAML metadata document from the file `SAMLMetaData.xml`. Note that you must use the `-Raw` switch parameter to successfully process the contents of the JSON file.

```
Update-IAMSAMLProvider -SAMLProviderArn arn:aws:iam::123456789012:saml-provider/
SAMLADFS -SAMLMetadataDocument (Get-Content -Raw SAMLMetaData.xml)
```

- For API details, see UpdateSamlProvider in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateServerCertificate` with an AWS SDK or CLI

The following code examples show how to use `UpdateServerCertificate`.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::updateServerCertificate(const Aws::String
 &currentCertificateName,
                                           const Aws::String &newCertificateName,
                                           const Aws::Client::ClientConfiguration
 &clientConfig) {
    Aws::IAM::IAMClient iam(clientConfig);
    Aws::IAM::Model::UpdateServerCertificateRequest request;
    request.SetServerCertificateName(currentCertificateName);
    request.SetNewServerCertificateName(newCertificateName);
```

```
    auto outcome = iam.UpdateServerCertificate(request);
    bool result = true;
    if (outcome.IsSuccess()) {
        std::cout << "Server certificate " << currentCertificateName
                  << " successfully renamed as " << newCertificateName
                  << std::endl;
    }
    else {
        if (outcome.GetError().GetErrorType() !=
 Aws::IAM::IAMErrors::NO_SUCH_ENTITY) {
            std::cerr << "Error changing name of server certificate " <<
                      currentCertificateName << " to " << newCertificateName <<
 ":" <<
                      outcome.GetError().GetMessage() << std::endl;
            result = false;
        }
        else {
            std::cout << "Certificate '" << currentCertificateName
                      << "' not found." << std::endl;
        }
    }

    return result;
}
```

- For API details, see UpdateServerCertificate in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To change the path or name of a server certificate in your AWS account

The following `update-server-certificate` command changes the name of the certificate from `myServerCertificate` to `myUpdatedServerCertificate`. It also changes the path to `/cloudfront/` so that it can be accessed by the Amazon CloudFront service. This command produces no output. You can see the results of the update by running the `list-server-certificates` command.

```
aws-iam update-server-certificate \
```

```
    --server-certificate-name myServerCertificate \
    --new-server-certificate-name myUpdatedServerCertificate \
    --new-path /cloudfront/
```

This command produces no output.

For more information, see Managing server certificates in IAM in the *AWS IAM User Guide*.

- For API details, see UpdateServerCertificate in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Update a server certificate.

```
import { UpdateServerCertificateCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} currentName
 * @param {string} newName
 */
export const updateServerCertificate = (currentName, newName) => {
  const command = new UpdateServerCertificateCommand({
    ServerCertificateName: currentName,
    NewServerCertificateName: newName,
  });

  return client.send(command);
};
```

- For more information, see AWS SDK for JavaScript Developer Guide.

- For API details, see UpdateServerCertificate in *AWS SDK for JavaScript API Reference*.

SDK for JavaScript (v2)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// Load the AWS SDK for Node.js
var AWS = require("aws-sdk");
// Set the region
AWS.config.update({ region: "REGION" });

// Create the IAM service object
var iam = new AWS.IAM({ apiVersion: "2010-05-08" });

var params = {
  ServerCertificateName: "CERTIFICATE_NAME",
  NewServerCertificateName: "NEW_CERTIFICATE_NAME",
};

iam.updateServerCertificate(params, function (err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see UpdateServerCertificate in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example renames the certificate named `MyServerCertificate` to `MyRenamedServerCertificate`.

```
Update-IAMServerCertificate -ServerCertificateName MyServerCertificate -
NewServerCertificateName MyRenamedServerCertificate
```

Example 2: This example moves the certificate named `MyServerCertificate` to the path `/Org1/Org2/`. This changes the ARN for the resource to `arn:aws:iam::123456789012:server-certificate/Org1/Org2/MyServerCertificate`.

```
Update-IAMServerCertificate -ServerCertificateName MyServerCertificate -NewPath /
Org1/Org2/
```

- For API details, see UpdateServerCertificate in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example renames the certificate named `MyServerCertificate` to `MyRenamedServerCertificate`.

```
Update-IAMServerCertificate -ServerCertificateName MyServerCertificate -
NewServerCertificateName MyRenamedServerCertificate
```

Example 2: This example moves the certificate named `MyServerCertificate` to the path `/Org1/Org2/`. This changes the ARN for the resource to `arn:aws:iam::123456789012:server-certificate/Org1/Org2/MyServerCertificate`.

```
Update-IAMServerCertificate -ServerCertificateName MyServerCertificate -NewPath /
Org1/Org2/
```

- For API details, see UpdateServerCertificate in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Ruby

SDK for Ruby

    @iam_client.delete_server_certificate(server_certificate_name: name)
    @logger.info("Server certificate '#{name}' deleted.")
    true
  rescue Aws::IAM::Errors::ServiceError => e
    @logger.error("Error deleting server certificate: #{e.message}")
    false
  end
end
```

- For API details, see UpdateServerCertificate in *AWS SDK for Ruby API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateSigningCertificate` with a CLI

The following code examples show how to use `UpdateSigningCertificate`.

CLI

AWS CLI

To activate or deactivate a signing certificate for an IAM user

The following `update-signing-certificate` command deactivates the specified signing certificate for the IAM user named Bob.

```
aws iam update-signing-certificate \
    --certificate-id TA7SMP42TDN5Z26OBPJE7EXAMPLE \
    --status Inactive \
    --user-name Bob
```

To get the ID for a signing certificate, use the `list-signing-certificates` command.

For more information, see Manage signing certificates in the *Amazon EC2 User Guide*.

- For API details, see UpdateSigningCertificate in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates the certificate that is associated with the IAM user named Bob and whose certificate ID si Y3EK7RMEXAMPLESV33FCREXAMPLEMJLU to mark it as inactive.

```
Update-IAMSigningCertificate -CertificateId Y3EK7RMEXAMPLESV33FCREXAMPLEMJLU -
UserName Bob -Status Inactive
```

- For API details, see UpdateSigningCertificate in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates the certificate that is associated with the IAM user named Bob and whose certificate ID si Y3EK7RMEXAMPLESV33FCREXAMPLEMJLU to mark it as inactive.

```
Update-IAMSigningCertificate -CertificateId Y3EK7RMEXAMPLESV33FCREXAMPLEMJLU -
UserName Bob -Status Inactive
```

- For API details, see UpdateSigningCertificate in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateUser` with an AWS SDK or CLI

The following code examples show how to use `UpdateUser`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Create read-only and read-write users

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::updateUser(const Aws::String &currentUserName,
                             const Aws::String &newUserName,
                             const Aws::Client::ClientConfiguration
 &clientConfig) {
    Aws::IAM::IAMClient iam(clientConfig);

    Aws::IAM::Model::UpdateUserRequest request;
    request.SetUserName(currentUserName);
    request.SetNewUserName(newUserName);
```

```
    auto outcome = iam.UpdateUser(request);
    if (outcome.IsSuccess()) {
        std::cout << "IAM user " << currentUserName <<
                  " successfully updated with new user name " << newUserName <<
                  std::endl;
    }
    else {
        std::cerr << "Error updating user name for IAM user " << currentUserName
 <<
                  ":" << outcome.GetError().GetMessage() << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see UpdateUser in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To change an IAM user's name

The following `update-user` command changes the name of the IAM user Bob to `Robert`.

```
aws iam update-user \
    --user-name Bob \
    --new-user-name Robert
```

This command produces no output.

For more information, see Renaming an IAM user group in the *AWS IAM User Guide*.

- For API details, see UpdateUser in *AWS CLI Command Reference*.

Use `UploadServerCertificate` with an AWS SDK or CLI

The following code examples show how to use `UploadServerCertificate`.

CLI

AWS CLI

To upload a server certificate to your AWS account

The following **upload-server-certificate** command uploads a server certificate to your AWS account. In this example, the certificate is in the file `public_key_cert_file.pem`, the associated private key is in the file `my_private_key.pem`, and the the certificate chain provided by the certificate authority (CA) is in the `my_certificate_chain_file.pem` file. When the file has finished uploading, it is available under the name *myServerCertificate*. Parameters that begin with `file://` tells the command to read the contents of the file and use that as the parameter value instead of the file name itself.

```
aws iam upload-server-certificate \
    --server-certificate-name myServerCertificate \
    --certificate-body file://public_key_cert_file.pem \
    --private-key file://my_private_key.pem \
    --certificate-chain file://my_certificate_chain_file.pem
```

Output:

```
{
    "ServerCertificateMetadata": {
        "Path": "/",
        "ServerCertificateName": "myServerCertificate",
        "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
        "Arn": "arn:aws:iam::1234567989012:server-certificate/
myServerCertificate",
        "UploadDate": "2019-04-22T21:13:44+00:00",
        "Expiration": "2019-10-15T22:23:16+00:00"
    }
}
```

For more information, see Creating, Uploading, and Deleting Server Certificates in the *Using IAM* guide.

- For API details, see UploadServerCertificate in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import { UploadServerCertificateCommand, IAMClient } from "@aws-sdk/client-iam";
import { readFileSync } from "node:fs";
import { dirnameFromMetaUrl } from "@aws-doc-sdk-examples/lib/utils/util-fs.js";
import * as path from "node:path";

const client = new IAMClient({});

const certMessage = `Generate a certificate and key with the following command,
 or the equivalent for your system.

openssl req -x509 -newkey rsa:4096 -sha256 -days 3650 -nodes \
-keyout example.key -out example.crt -subj "/CN=example.com" \
-addext "subjectAltName=DNS:example.com,DNS:www.example.net,IP:10.0.0.1"
`;

const getCertAndKey = () => {
  try {
    const cert = readFileSync(
      path.join(dirnameFromMetaUrl(import.meta.url), "./example.crt"),
    );
    const key = readFileSync(
      path.join(dirnameFromMetaUrl(import.meta.url), "./example.key"),
    );
    return { cert, key };
  } catch (err) {
    if (err.code === "ENOENT") {

    ServerCertificateName: certificateName,
    CertificateBody: cert.toString(),
    PrivateKey: key.toString(),
  });

  return client.send(command);
};
```

- For API details, see UploadServerCertificate in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example uploads a new server certificate to the IAM account. The files containing the certificate body, the private key, and (optionally) the certificate chain must all be PEM encoded. Note that the parameters require the actual content of the files rather than the file names. You must use the `-Raw` switch parameter to successfully process the file contents.

```
Publish-IAMServerCertificate -ServerCertificateName MyTestCert -CertificateBody
 (Get-Content -Raw server.crt) -PrivateKey (Get-Content -Raw server.key)
```

Output:

```
Arn                 : arn:aws:iam::123456789012:server-certificate/MyTestCert
```

```
Expiration            : 1/14/2018 9:52:36 AM
Path                  : /
ServerCertificateId   : ASCAJIEXAMPLE7J7HQZYW
ServerCertificateName : MyTestCert
UploadDate            : 4/21/2015 11:14:16 AM
```

- For API details, see UploadServerCertificate in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example uploads a new server certificate to the IAM account. The files containing the certificate body, the private key, and (optionally) the certificate chain must all be PEM encoded. Note that the parameters require the actual content of the files rather than the file names. You must use the -Raw switch parameter to successfully process the file contents.

```
Publish-IAMServerCertificate -ServerCertificateName MyTestCert -CertificateBody
 (Get-Content -Raw server.crt) -PrivateKey (Get-Content -Raw server.key)
```

Output:

```
Arn                   : arn:aws:iam::123456789012:server-certificate/MyTestCert
Expiration            : 1/14/2018 9:52:36 AM
Path                  : /
ServerCertificateId   : ASCAJIEXAMPLE7J7HQZYW
ServerCertificateName : MyTestCert
UploadDate            : 4/21/2015 11:14:16 AM
```

- For API details, see UploadServerCertificate in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Use `UploadSigningCertificate` with a CLI

The following code examples show how to use `UploadSigningCertificate`.

CLI

AWS CLI

To upload a signing certificate for an IAM user

The following `upload-signing-certificate` command uploads a signing certificate for the IAM user named Bob.

```
aws iam upload-signing-certificate \
    --user-name Bob \
    --certificate-body file://certificate.pem
```

Output:

```
{
    "Certificate": {
        "UserName": "Bob",
        "Status": "Active",
        "CertificateBody": "-----BEGIN CERTIFICATE-----<certificate-body>-----END
 CERTIFICATE-----",
        "CertificateId": "TA7SMP42TDN5Z26OBPJE7EXAMPLE",
        "UploadDate": "2013-06-06T21:40:08.121Z"
    }
}
```

The certificate is in a file named *certificate.pem* in PEM format.

For more information, see Creating and Uploading a User Signing Certificate in the *Using IAM* guide.

- For API details, see UploadSigningCertificate in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example uploads a new X.509 signing certificate and associates it with the IAM user named Bob. The file containing the certificate body is PEM encoded. The `CertificateBody` parameter requires the actual contents of the certificate file rather than the file name. You must use the `-Raw` switch parameter to successfully process the file.

```
Publish-IAMSigningCertificate -UserName Bob -CertificateBody (Get-Content -Raw
 SampleSigningCert.pem)
```

Output:

```
CertificateBody : -----BEGIN CERTIFICATE-----

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Scenarios for IAM using AWS SDKs

The following code examples show you how to implement common scenarios in IAM with AWS SDKs. These scenarios show you how to accomplish specific tasks by calling multiple functions within IAM or combined with other AWS services. Each scenario includes a link to the complete source code, where you can find instructions on how to set up and run the code.

Scenarios target an intermediate level of experience to help you understand service actions in context.

Examples

- Build and manage a resilient service using an AWS SDK
- Configure container service connectivity
- Create a container task for the serverless launch type
- Create a rest API with function proxy integration
- Create read-only and read-write IAM users using an AWS SDK
- Creating a container service for virtual machine instances
- Creating a managed monitoring workspace
- Creating a monitoring dashboard with function name as a variable
- Creating your first serverless function
- Get started with serverless data warehouses using the CLI
- Getting started with configuration management
- Getting started with internet of things device protection
- Getting started with machine learning feature stores

- Getting started with managed kubernetes clusters
- Getting started with managed streaming
- Getting started with provisioned data warehouse clusters
- Getting started with workflow orchestration
- Manage IAM access keys using an AWS SDK
- Manage IAM policies using an AWS SDK
- Manage IAM roles using an AWS SDK
- Manage your IAM account using an AWS SDK
- Moving hardcoded secrets to secure secret storage
- Allows the AWS Compute Optimizer Automation feature to apply recommended actions
- Policy to enable Automation across your organization
- Policy to enable Automation for your account
- Policy to grant full access to Compute Optimizer Automation for a management account of an organization
- Policy to grant full access to Compute Optimizer Automation for standalone AWS accounts
- Policy to grant read-only access to Compute Optimizer Automation for a management account of an organization
- Policy to grant read-only access to Compute Optimizer Automation for standalone AWS accounts
- Policy to grants service-linked role permissions for Compute Optimization Automation
- Roll back an IAM policy version using an AWS SDK
- Run CPU stress tests on virtual machine instances using fault injection
- Set up Attribute-Based Access Control for DynamoDB using AWS Command Line Interface v2
- Setting up systems management
- Using property variables in monitoring dashboards to monitor multiple serverless functions
- Work with DynamoDB Streams and Time-to-Live using AWS Command Line Interface v2
- Work with the IAM Policy Builder API using an AWS SDK

Build and manage a resilient service using an AWS SDK

The following code examples show how to create a load-balanced web service that returns book, movie, and song recommendations. The example shows how the service responds to failures, and how to restructure the service for more resilience when failures occur.

- Use an Amazon EC2 Auto Scaling group to create Amazon Elastic Compute Cloud (Amazon EC2) instances based on a launch template and to keep the number of instances in a specified range.
- Handle and distribute HTTP requests with Elastic Load Balancing.
- Monitor the health of instances in an Auto Scaling group and forward requests only to healthy instances.
- Run a Python web server on each EC2 instance to handle HTTP requests. The web server responds with recommendations and health checks.
- Simulate a recommendation service with an Amazon DynamoDB table.
- Control web server response to requests and health checks by updating AWS Systems Manager parameters.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Run the interactive scenario at a command prompt.

```
    static async Task Main(string[] args)
    {
        _configuration = new ConfigurationBuilder()
            .SetBasePath(Directory.GetCurrentDirectory())
            .AddJsonFile("settings.json") // Load settings from .json file.
            .AddJsonFile("settings.local.json",
                true) // Optionally, load local settings.
            .Build();

        // Set up dependency injection for the AWS services.
        using var host = Host.CreateDefaultBuilder(args)
            .ConfigureLogging(logging =>
                logging.AddFilter("System", LogLevel.Debug)
                    .AddFilter<DebugLoggerProvider>("Microsoft",
LogLevel.Information)
```

```
                    .AddFilter<ConsoleLoggerProvider>("Microsoft",
LogLevel.Trace))
            .ConfigureServices((_, services) =>

Configure container service connectivity

The following code example shows how to:

- Create the VPC infrastructure
- Set up logging
- Create the ECS cluster
- Configure IAM roles

- Create the service with Service Connect
- Verify the deployment
- Clean up resources

Bash

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

Create a container task for the serverless launch type

The following code example shows how to:

- Create the cluster
- Create a task definition
- Create the service
- Clean up

Bash

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash
```

```
# Amazon ECS Fargate Tutorial Script - Version 5

Create a rest API with function proxy integration

The following code example shows how to:

- Create an IAM role for Lambda execution
- Create and deploy a Lambda function
- Create a REST API
- Configure Lambda proxy integration
- Deploy and test the API
- Clean up resources

Bash

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

set -euo pipefail

# Simple API Gateway Lambda Integration Script
# This script creates a REST API with Lambda proxy integration

Create read-only and read-write IAM users using an AWS SDK

The following code example shows how to create users and attach policies to them.

> **Warning**
>
> To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as AWS IAM Identity Center.

- Create two IAM users.
- Attach a policy for one user to get and put objects in an Amazon S3 bucket.
- Attach a policy for the second user to get objects from the bucket.
- Get different permissions to the bucket based on user credentials.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create functions that wrap IAM user actions.

```
import logging

Creating a managed monitoring workspace

The following code example shows how to:

- Create an IAM role for your workspace
- Create a Grafana workspace
- Configure authentication
- Configure optional settings
- Clean up resources

Bash

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# Amazon Managed Grafana Workspace Creation Script
# This script creates an Amazon Managed Grafana workspace and configures it
```

```
# Set up logging
LOG_FILE="grafana-workspace-creation.log"
exec > >(tee -a "$LOG_FILE") 2>&1

echo "Starting Amazon Managed Grafana workspace creation script at $(date)"
echo "All commands and outputs will be logged to $LOG_FILE"

# Function to check for errors in command output

Creating a monitoring dashboard with function name as a variable

The following code example shows how to:

- Create a CloudWatch dashboard
- Add Lambda metrics widgets with a function name variable
- Verify the dashboard
- Clean up resources

Bash

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# Script to create a CloudWatch dashboard with Lambda function name as a variable
# This script creates a CloudWatch dashboard that allows you to switch between
 different Lambda functions

# Set up logging with secure permissions
LOG_FILE="${HOME}/.cloudwatch-dashboard-script.log"
touch "$LOG_FILE" && chmod 600 "$LOG_FILE"
exec > >(tee -a "$LOG_FILE") 2>&1
```

```
echo "$(date): Starting CloudWatch dashboard creation script"

# Security: Set strict error handling
set -uo pipefail
trap 'handle_error "Script failed at line $LINENO"' ERR

# Function to handle errors
handle_error() {

Creating your first serverless function

The following code example shows how to:

- Create an IAM role for Lambda
- Create function code
- Create a Lambda function
- Test your Lambda function

- Clean up resources

Bash

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash
# AWS Lambda - Create Your First Function
# This script creates a Lambda function, invokes it with a test event,
# views CloudWatch logs, and cleans up all resources.
#
# Source: https://docs.aws.amazon.com/lambda/latest/dg/getting-started.html
#
# Resources created:
#   - IAM role (Lambda execution role with basic logging permissions)
#   - Lambda function (Python 3.13 or Node.js 22.x runtime)
#   - CloudWatch log group (created automatically by Lambda on invocation)

Get started with serverless data warehouses using the CLI

The following code example shows how to:

- Use secrets-manager CreateSecret
- Use secrets-manager DeleteSecret
- Use secrets-manager GetSecretValue
- Use redshift CreateNamespace
- Use redshift CreateWorkgroup
- Use redshift DeleteNamespace
- Use iam CreateRole

Bash

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# Amazon Redshift Serverless Tutorial Script with Secrets Manager (No jq
 dependency)
# This script creates a Redshift Serverless environment, loads sample data, and
 runs queries
# Uses AWS Secrets Manager for secure password management without requiring jq

# Set up logging

Getting started with configuration management

The following code example shows how to:

- Create an Amazon S3 bucket
- Create an Amazon SNS topic
- Create an IAM role for Config
- Set up the Config configuration recorder
- Set up the Config delivery channel
- Start the configuration recorder
- Verify the Config setup

Bash

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# AWS Config Setup Script (v2)
# This script sets up AWS Config with the AWS CLI

# Error handling
set -e
LOGFILE="aws-config-setup-v2.log"
touch $LOGFILE
exec > >(tee -a $LOGFILE)
exec 2>&1

# Function to handle errors
handle_error() {
    echo "ERROR: An error occurred at line $1"
    echo "Attempting to clean up resources..."

Getting started with internet of things device protection

The following code example shows how to:

- Create Required IAM Roles
- Enable IoT Device Defender Audit Checks
- Run an On-Demand Audit
- Create a Mitigation Action
- Apply Mitigation Actions to Findings
- Set Up SNS Notifications (Optional)
- Enable IoT Logging

Bash

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# AWS IoT Device Defender Getting Started Script
# This script demonstrates how to use AWS IoT Device Defender to enable audit
 checks,
# view audit results, create mitigation actions, and apply them to findings.
```

```
set -euo pipefail

# Set up logging
LOG_FILE="iot-device-defender-script-$(date +%Y%m%d%H%M%S).log"
exec > >(tee -a "$LOG_FILE") 2>&1

Getting started with machine learning feature stores

The following code example shows how to:

- Set up IAM permissions
- Create a SageMaker execution role
- Create feature groups
- Clean up resources

Bash

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# Amazon SageMaker Feature Store Tutorial Script - Version 3
# This script demonstrates how to use Amazon SageMaker Feature Store with AWS CLI

# Setup logging
LOG_FILE="sagemaker-featurestore-tutorial.log"

Getting started with managed kubernetes clusters

The following code example shows how to:

- Create a VPC for your EKS cluster
- Create IAM roles for your EKS cluster
- Create your EKS cluster
- Configure kubectl to communicate with your cluster
- Create a managed node group
- Clean up resources

Bash

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# Amazon EKS Cluster Creation Script (v2)
# This script creates an Amazon EKS cluster with a managed node group using the
 AWS CLI

# Set up logging
LOG_FILE="eks-cluster-creation-v2.log"
exec > >(tee -a "$LOG_FILE") 2>&1

echo "Starting Amazon EKS cluster creation script at $(date)"
echo "All commands and outputs will be logged to $LOG_FILE"

# Error handling function
handle_error() {
    echo "ERROR: $1"

Getting started with managed streaming

The following code example shows how to:

- Create an MSK cluster
- Create IAM permissions for MSK access
- Create a client machine
- Get bootstrap brokers
- Set up the client machine
- Create a topic and produce/consume data
- Clean up resources

Bash

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# Amazon MSK Getting Started Tutorial Script - Version 8
# This script automates the steps in the Amazon MSK Getting Started tutorial
# It creates an MSK cluster, sets up IAM permissions, creates a client machine,
# and configures the client to interact with the cluster

# Set up logging
LOG_FILE="msk_tutorial_$(date +%Y%m%d_%H%M%S).log"
exec > >(tee -a "$LOG_FILE") 2>&1

echo "Starting Amazon MSK Getting Started Tutorial Script - Version 8"

Getting started with provisioned data warehouse clusters

The following code example shows how to:

- Create a Redshift cluster
- Create an IAM role for S3 access
- Create tables and load data
- Run example queries
- Clean up resources

Bash

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# Amazon Redshift Provisioned Cluster Tutorial Script
# This script creates a Redshift cluster, loads sample data, runs queries, and
 cleans up resources
# Version 4: Security improvements and best practices

set -euo pipefail

# Set up logging
```

```
LOG_FILE="redshift_tutorial.log"
exec > >(tee -a "$LOG_FILE") 2>&1

echo "Starting Amazon Redshift tutorial script at $(date)"
echo "All commands and outputs will be logged to $LOG_FILE"

# Function to handle errors
handle_error() {
    echo "ERROR: $1" >&2
    echo "Resources created so far:"
